Software Configuration Management (SCM)

- **Version Control** \approx Software Configuration Management (SCM)
 - A software engineering discipline
 - Consists of techniques, practices and tools for working on shared source code and files
 - Mechanisms for management, control and tracking the changes
 - Defines the process of **change management**
 - Keeps track of what is happening in the project over the time
 - Solves conflicts in the changes

SCM and the Software Development Lifecycle

Version Control

Managing Different Versions
of the Same File / Document

Version Control Systems (VCS)

- Functionality
 - File versions control
 - Merge and differences search
 - Branching
 - File locking
 - Console and GUI clients
- Well known products
 - CVS, Subversion (SVN) – free, open source
 - Git, Mercurial – distributed, free, open source
 - Perforce, Microsoft TFS – commercial

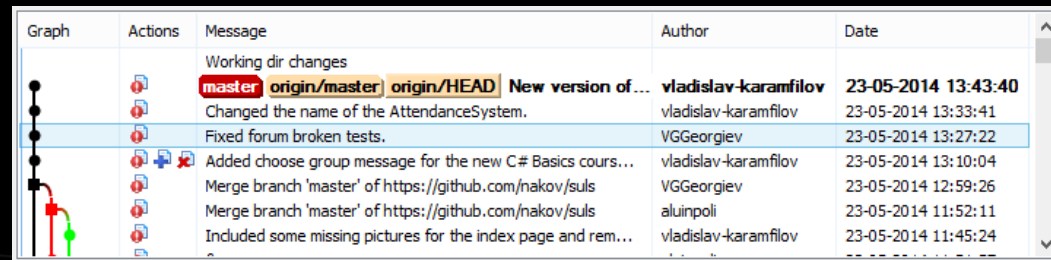

Version Control (Revision Control)

- Constantly used in software engineering
 - During the software development
 - While working with documents
- Changes are identified with an increment of the **version number**
 - for example 1.0, 2.0, 2.17
- Version numbers are historically linked with the person who created them
 - Full change logs are kept

Change Log

- Systems for version control keep a complete **change log** (history)
 - The date and hour of every change
 - The user who made the change
 - The files changed + old and new version
- Old versions can be retrieved, examined and compared
- It is possible to return to an old version (revert)

Graph	Actions	Message	Author	Date
		Working dir changes

Vocabulary

- **Repository** (source control repository)
 - A server that stores the files (documents)
 - Keeps a change log
- **Revision, Version**
 - Individual version (state) of a document that is a result of multiple changes
- **Check-Out, Clone**
 - Retrieves a working copy of the files from a remote repository into a local directory
 - It is possible to lock the files

Vocabulary (2)

- Change

- A modification to a local file (document) that is under version control

- Change Set / Change List

- A set of changes to multiple files that are going to be committed at the same time

- Commit, Check-In

- Submits the changes made from the local working copy to the repository
- Automatically creates a new version
- Conflicts may occur!

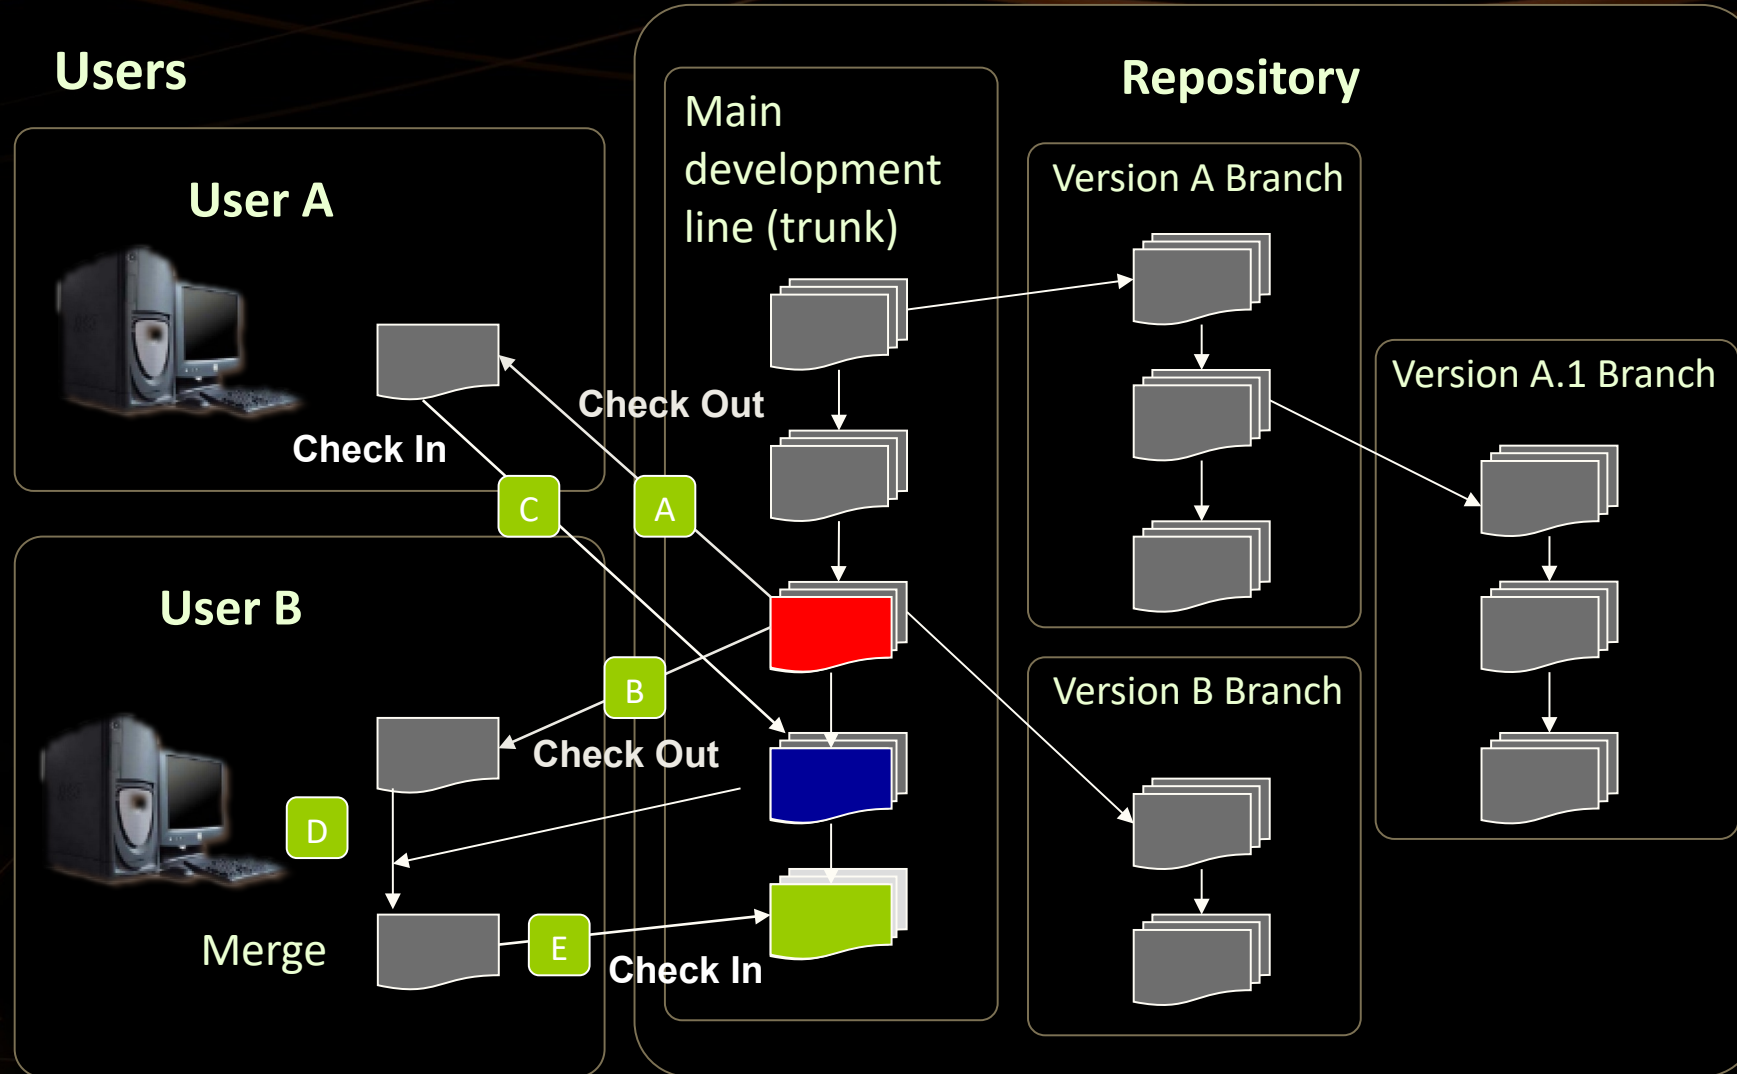

Vocabulary (3)

- **Conflict**
 - The simultaneous change to a certain file by multiple users
 - Can be solved automatically and manually
- **Update, Get Latest Version, Fetch / Pull**
 - Download the latest version of the files from the repository to a local working directory + merge conflicting files
- **Undo Check-Out, Revert / Undo Changes**
 - Cancels the local changes
 - Restores their state from the repository

Vocabulary (4)

- Merge
 - Combines the changes to a file changed locally and simultaneously in the repository
 - Can be automated in most cases
- Label / Tag
 - Labels mark with a name a group of files in a given version
 - For example a release
- Branch / Branching
 - Division of the repositories in a number of separate workflows

Version Control: Typical Scenario

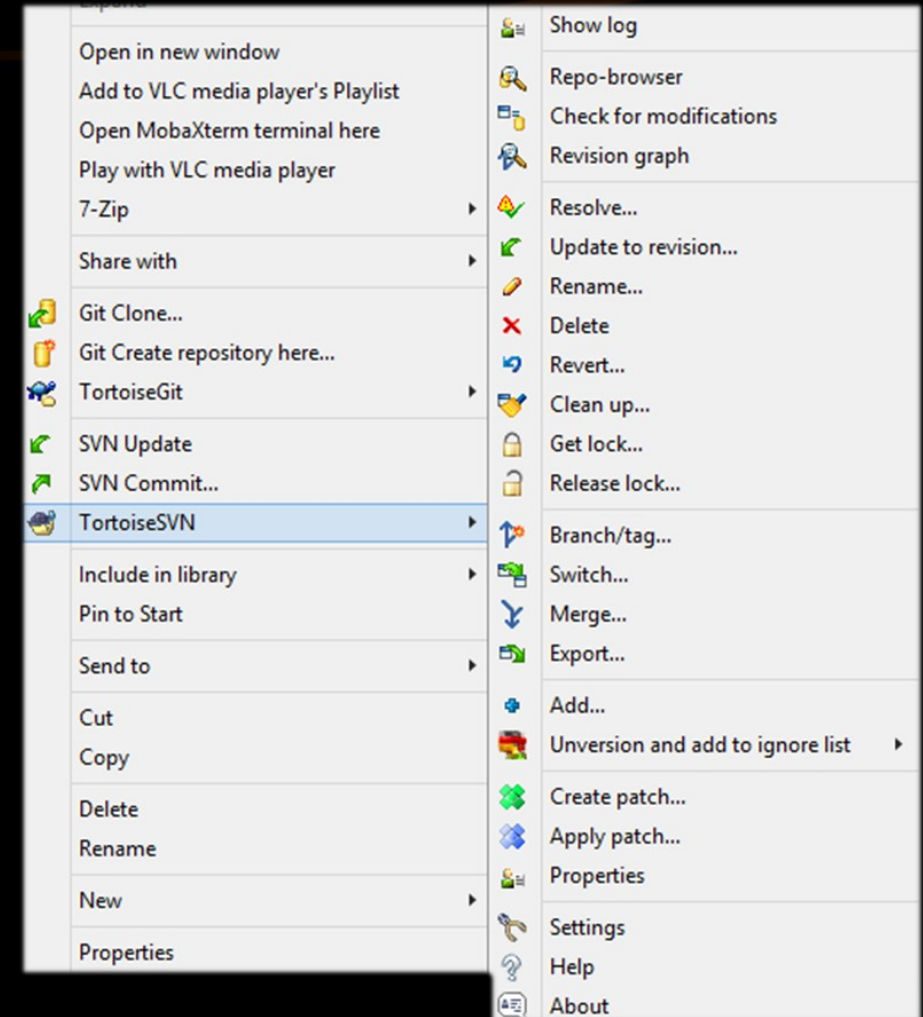

Subversion

Using Subversion and TortoiseSVN

Subversion (SVN)

- Subversion (SVN)
 - Open source SCM repository
 - <http://subversion.tigris.org>
 - Runs on Linux, Windows, Mac OS
- Console client
 - **svn**
- GUI client – TortoiseSVN
 - <http://tortoisesvn.tigris.org>
- Visual Studio / Eclipse plug-ins

Subversion – Features

- Versioning of the directory structure
- Complete change log
 - Deletion of files and directories
 - Renaming of files and directories
 - Saving of files or directories
- Can work on it's own or integrated with Apache as a module
- Simple to use, based on central SVN repository
- Works effectively with tags and branches

SVN – Console Client

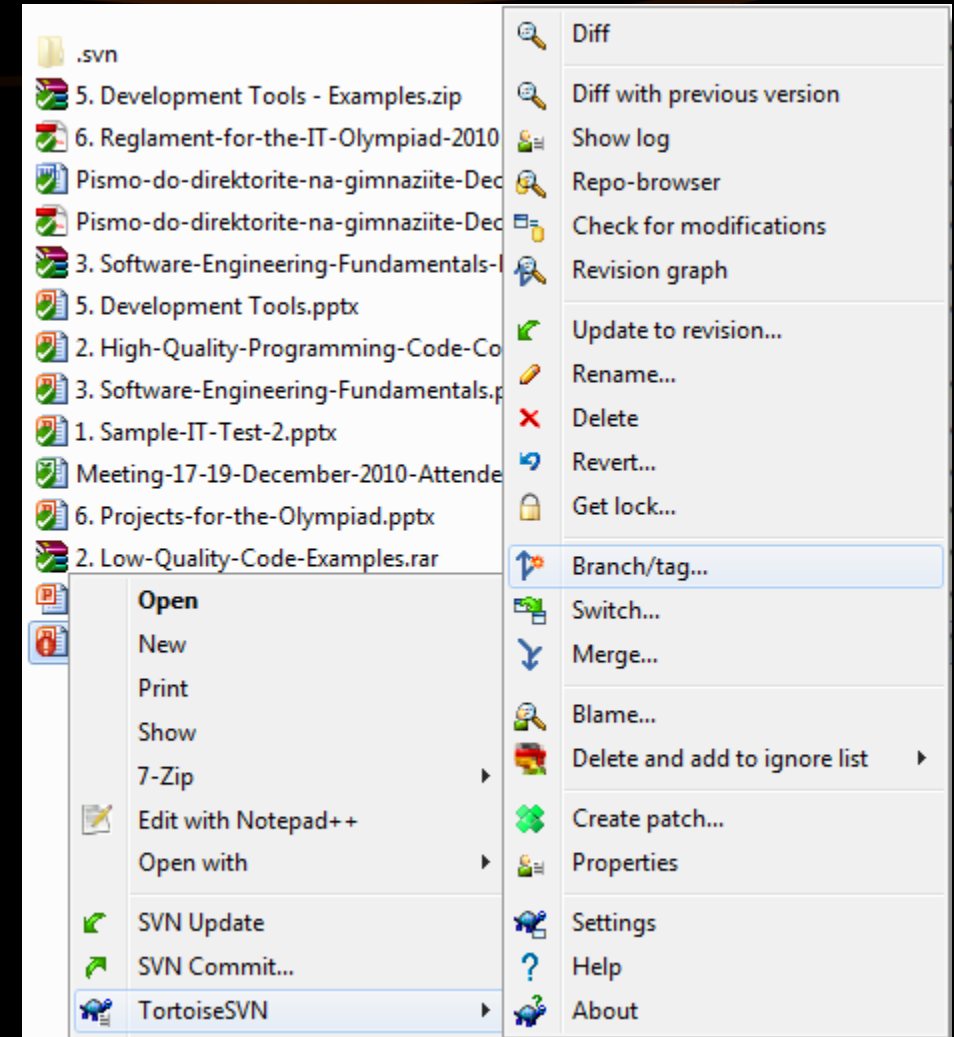

```
C:\WINDOWS\system32\cmd.exe

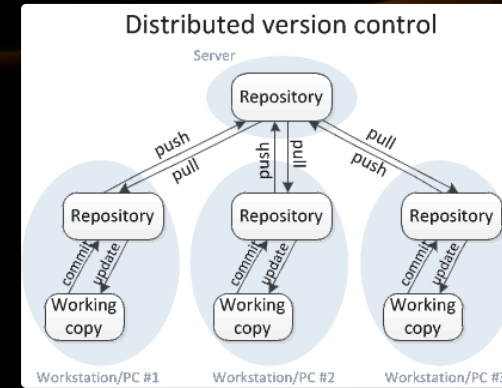

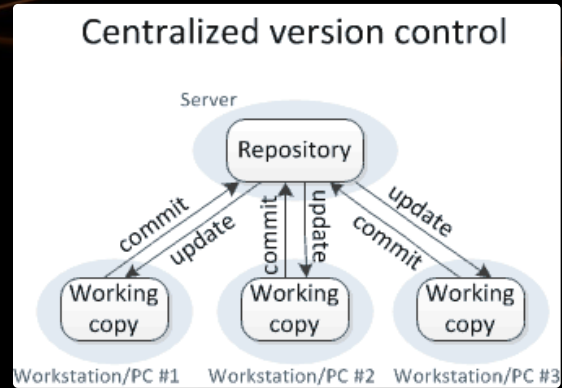

C:\test>svn checkout http://svn.softuni.org/admin/svn/csharp-basics/May-2014
A      May-2014\1. Introduction-to-Programming.pptx
A      May-2014\2. Primitive-Data-Types-and-Variables-Homework.docx
A      May-2014\2. Primitive-Data-Types-and-Variables-Demos.zip
A      May-2014\2. Primitive-Data-Types-and-Variables.pptx
A      May-2014\TODO.txt
A      May-2014\1. Introduction-to-Programming-Homework.docx
A      May-2014\1. Introduction-to-Programming-Demos.zip
A      May-2014\0. CSharp-Basics-Course-Introduction.pptx
Checked out revision 125.

C:\test>_
```

TortoiseSVN

- TortoiseSVN
 - Open source GUI client for Subversion for Windows
 - Integrated in Windows Explorer
 - <http://tortoisesvn.tigris.org>

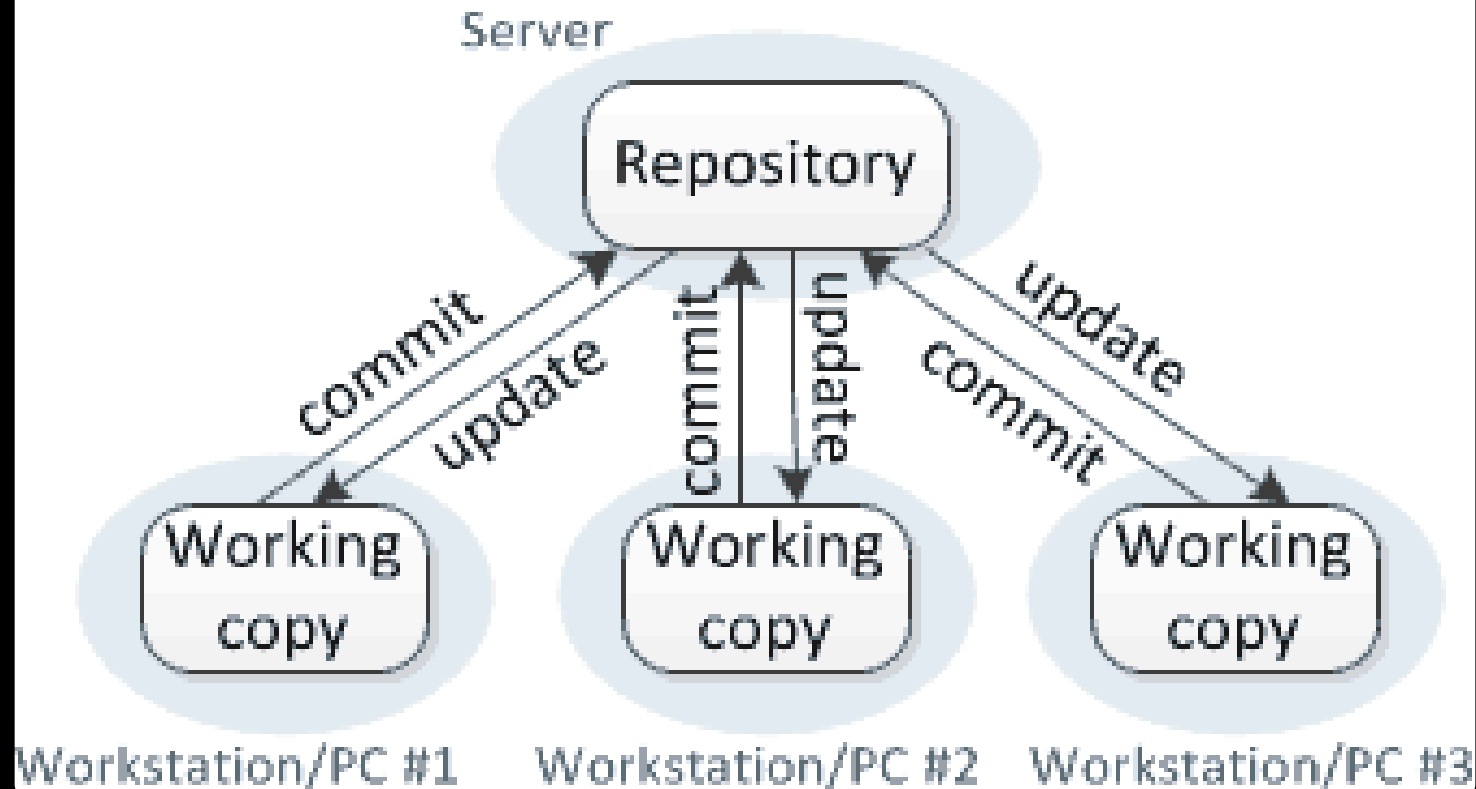

Versioning Models

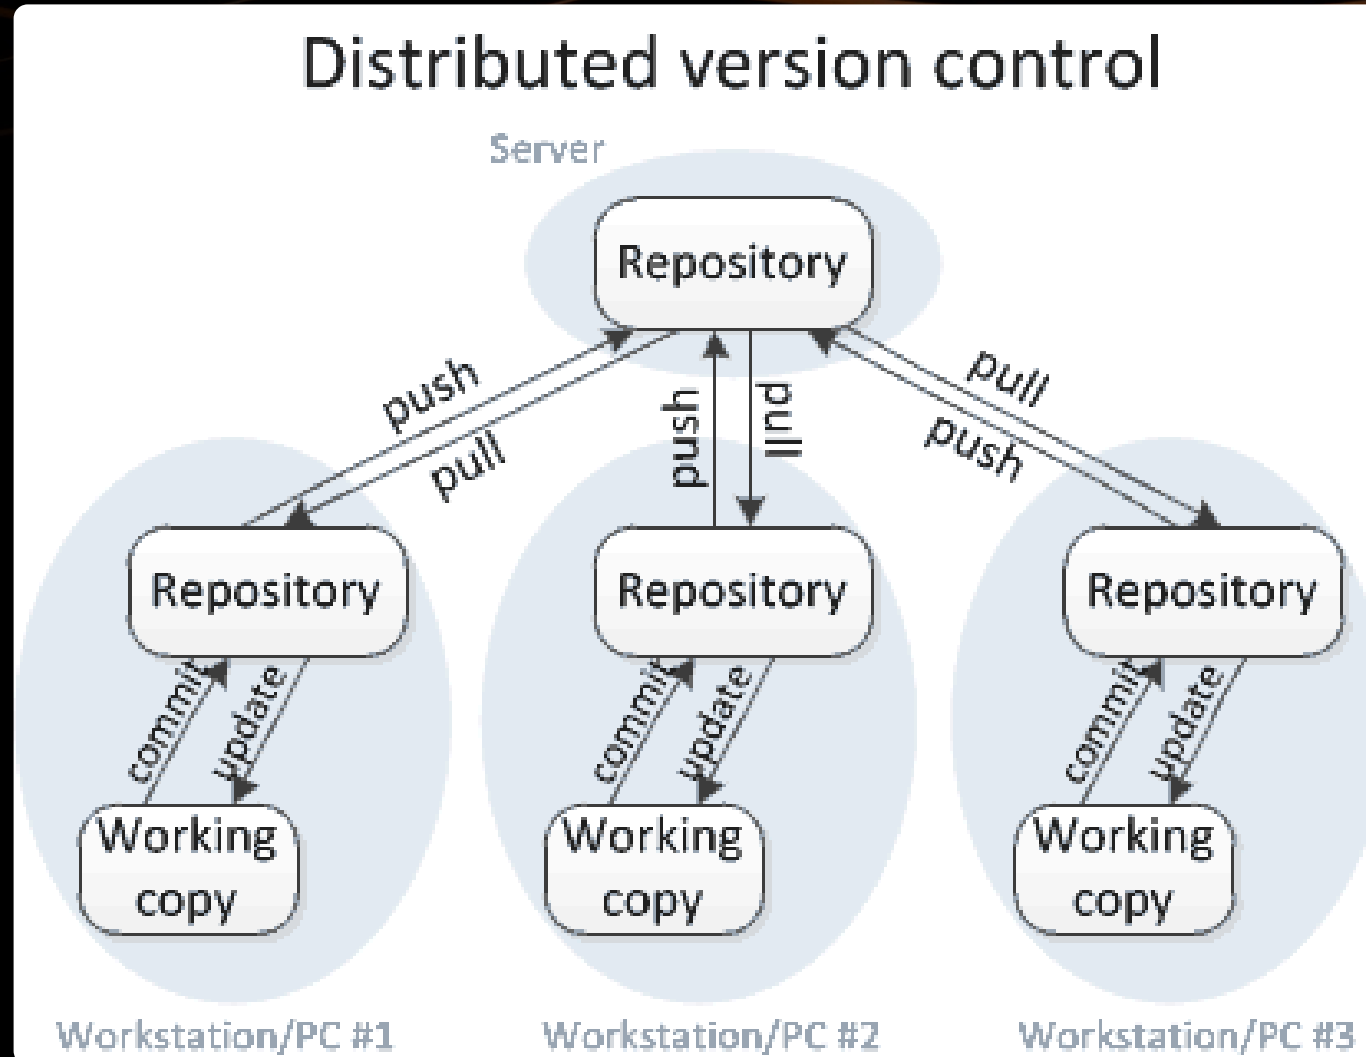

Lock-Modify-Unlock,
Copy-Modify-Merge,
Distributed Version Control

Centralized Version Control

Centralized version control

Distributed Version Control

Versioning Models

- Lock-Modify-Unlock
 - Only one user works on a given file at a time
 - No conflicts occur
 - Users wait each other for the locked files → works for small development teams only
 - Pessimistic concurrency control
- Examples:
 - Visual SourceSafe (VSS) – old fashioned
 - SVN, Git, TFS (with exclusive locking)
- Lock-modify-unlock is rarely used

Versioning Models (2)

- Copy-Modify-Merge

- Users make parallel changes to their own working copies
- Conflicts are possible when multiple user edit the same file
 - Conflicting changes are merged and the final version emerges (automatic and manual merge)

- Optimistic concurrency control

- Examples:

- SVN, Git, TFS

Versioning Models (3)

■ Distributed Version Control

- Users work in their own repository
 - Using the Lock-Modify-Unlock model
 - Local changes are locally committed
 - No concurrency, no local conflicts
- From time to time, the local repository is pushed to the central repository
 - Conflicts are possible and merges often occur
- Example of distributed version control systems:
 - Git, Mercurial

Problems with Locking

- Administrative problems:
 - Someone locks a given file and forgets about it
 - Time is lost while waiting for someone to release a file → works in small teams only
- Unneeded locking of the whole file
 - Different changes are not necessary in conflict
 - Example of non-conflicting changes:
 - Andy works at the beginning of the file
 - Bobby works at the end of the file

Merging Problems

- When a file is concurrently modified, changes should be merged
 - Merging is hard!
 - It is not always automatic process
- Coordination and responsibility between the developers is required
 - Commit changes as early as finished
 - Do not commit code that does not compile or blocks the work of the others
 - Leave meaningful comments at each commit

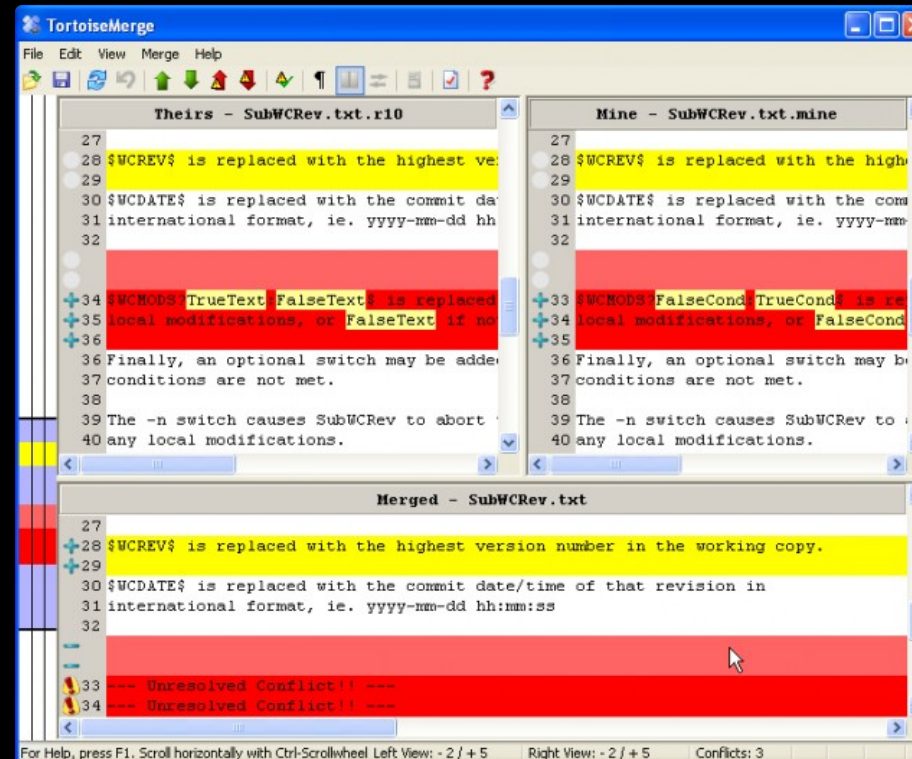

File Comparison / Merge Tools

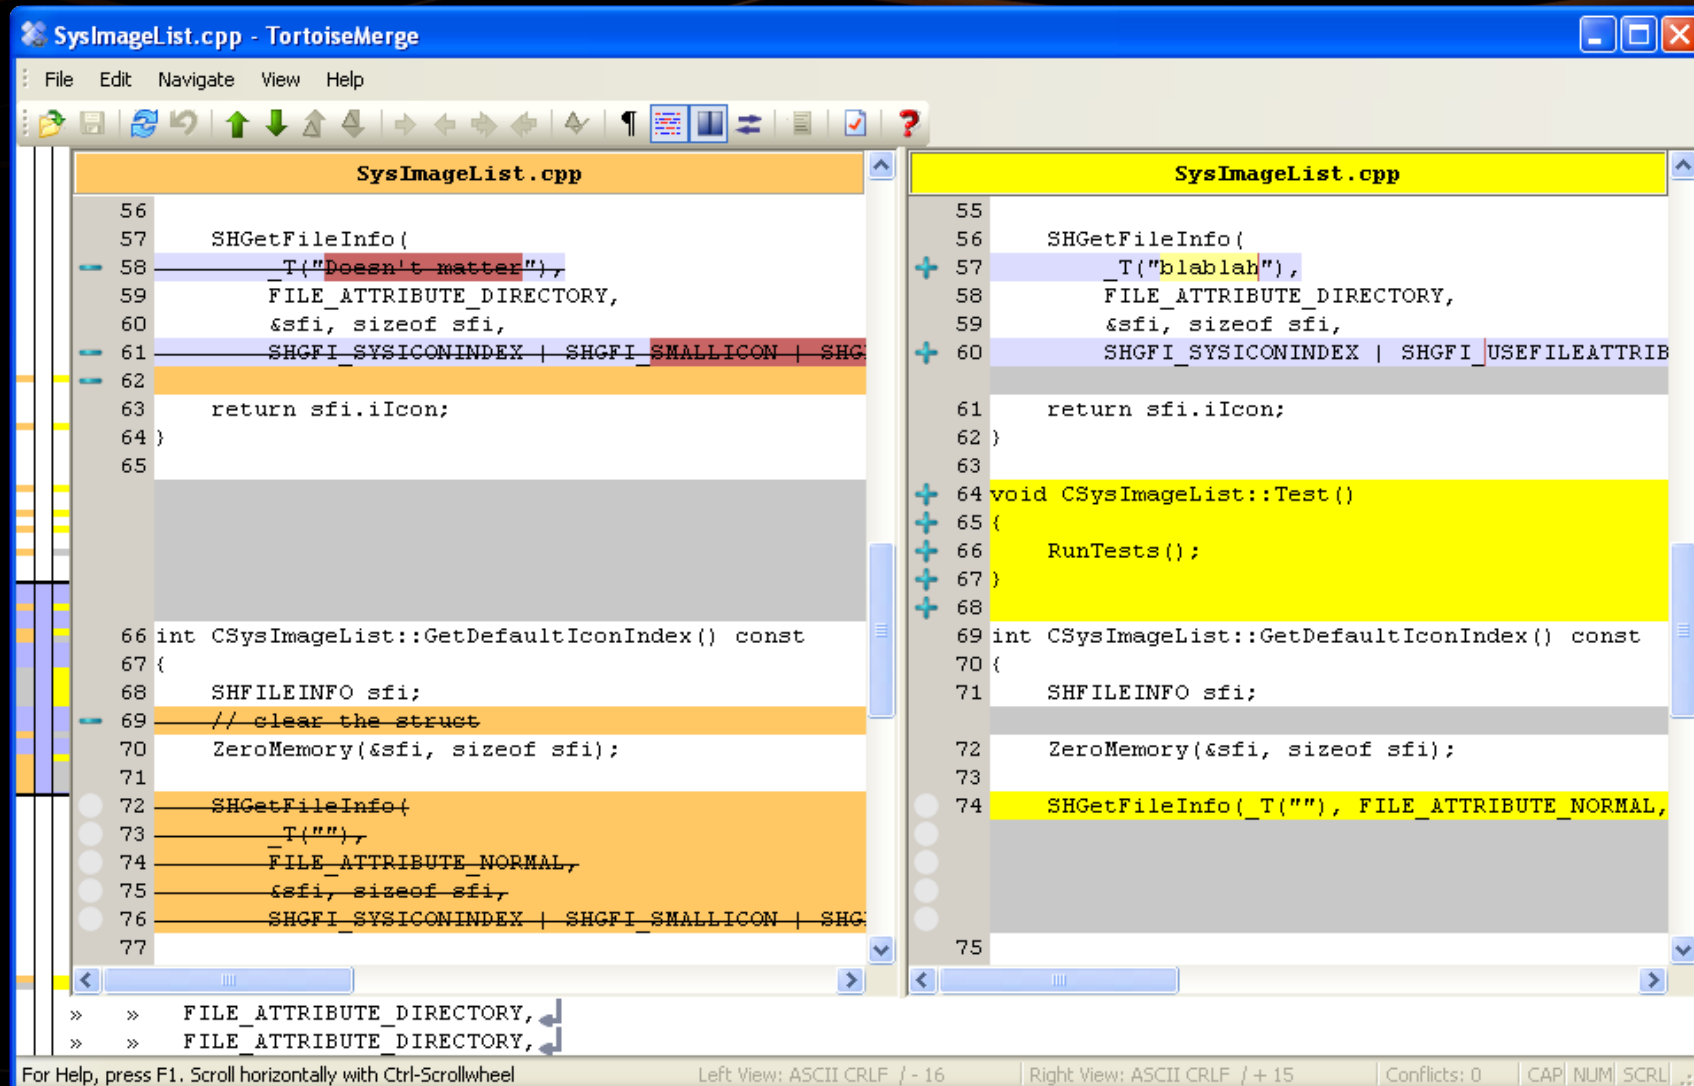

- During manual merge use file comparison
- There are visual comparison / merge tools:

- TortoiseMerge
- WinDiff
- AraxisMerge
- WinMerge
- BeyondCompare
- CompareIt

...

File Comparison – Example

The screenshot shows the TortoiseMerge application comparing two versions of `SysImageList.cpp`. The left pane shows the original file with line numbers 56 to 77. The right pane shows the modified file with line numbers 55 to 75. The comparison highlights several changes:

- Line 58: `T("Doesn't matter")` is replaced by `T("blablab")`.
- Line 60: `SHGFI_SYSICONINDEX | SHGFI_SMALLICON | SHGFI_USEFILEATTRIB` is added to the flags.
- Line 69: `// clear the struct` is replaced by `ZeroMemory(&sfi, sizeof sfi);`.
- Line 72: `SHGFI_SYSICONINDEX | SHGFI_SMALLICON | SHGFI_USEFILEATTRIB` is added to the flags.
- Line 74: `SHGFI_SYSICONINDEX | SHGFI_SMALLICON | SHGFI_USEFILEATTRIB` is added to the flags.

The status bar at the bottom indicates: For Help, press F1. Scroll horizontally with Ctrl-Scrollwheel. Left View: ASCII CRLF / - 16. Right View: ASCII CRLF / + 15. Conflicts: 0. CAP|NUM|SCRL|...

The "Lock-Modify- Unlock" Model

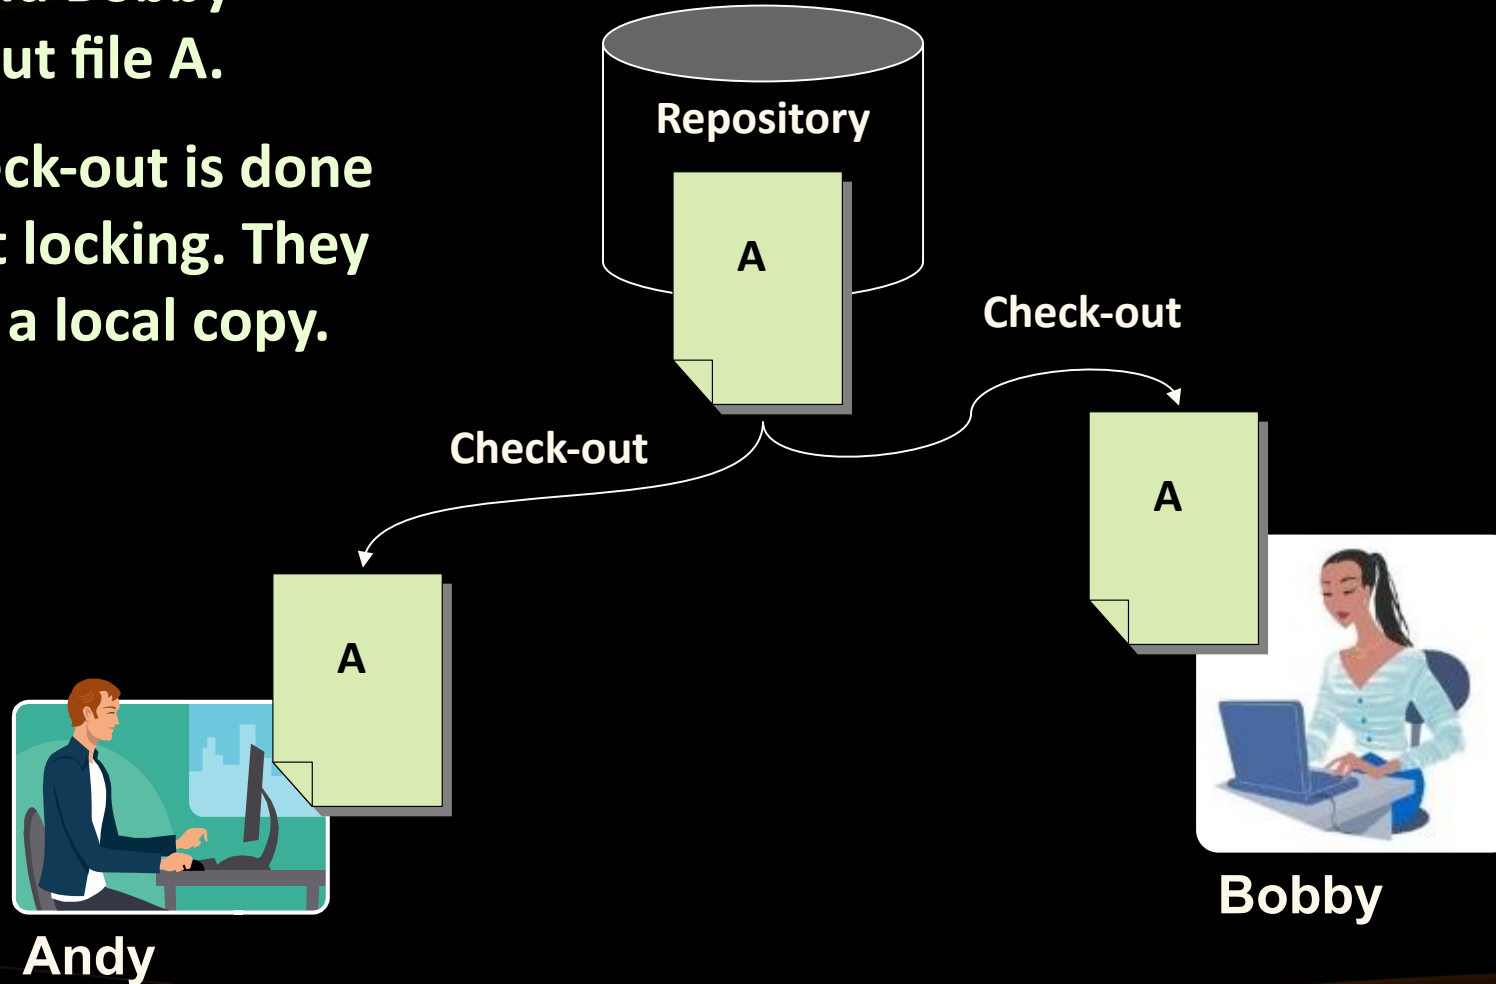

The Lock-Modify-Unlock Model (1)

Andy and Bobby
check-out file A.

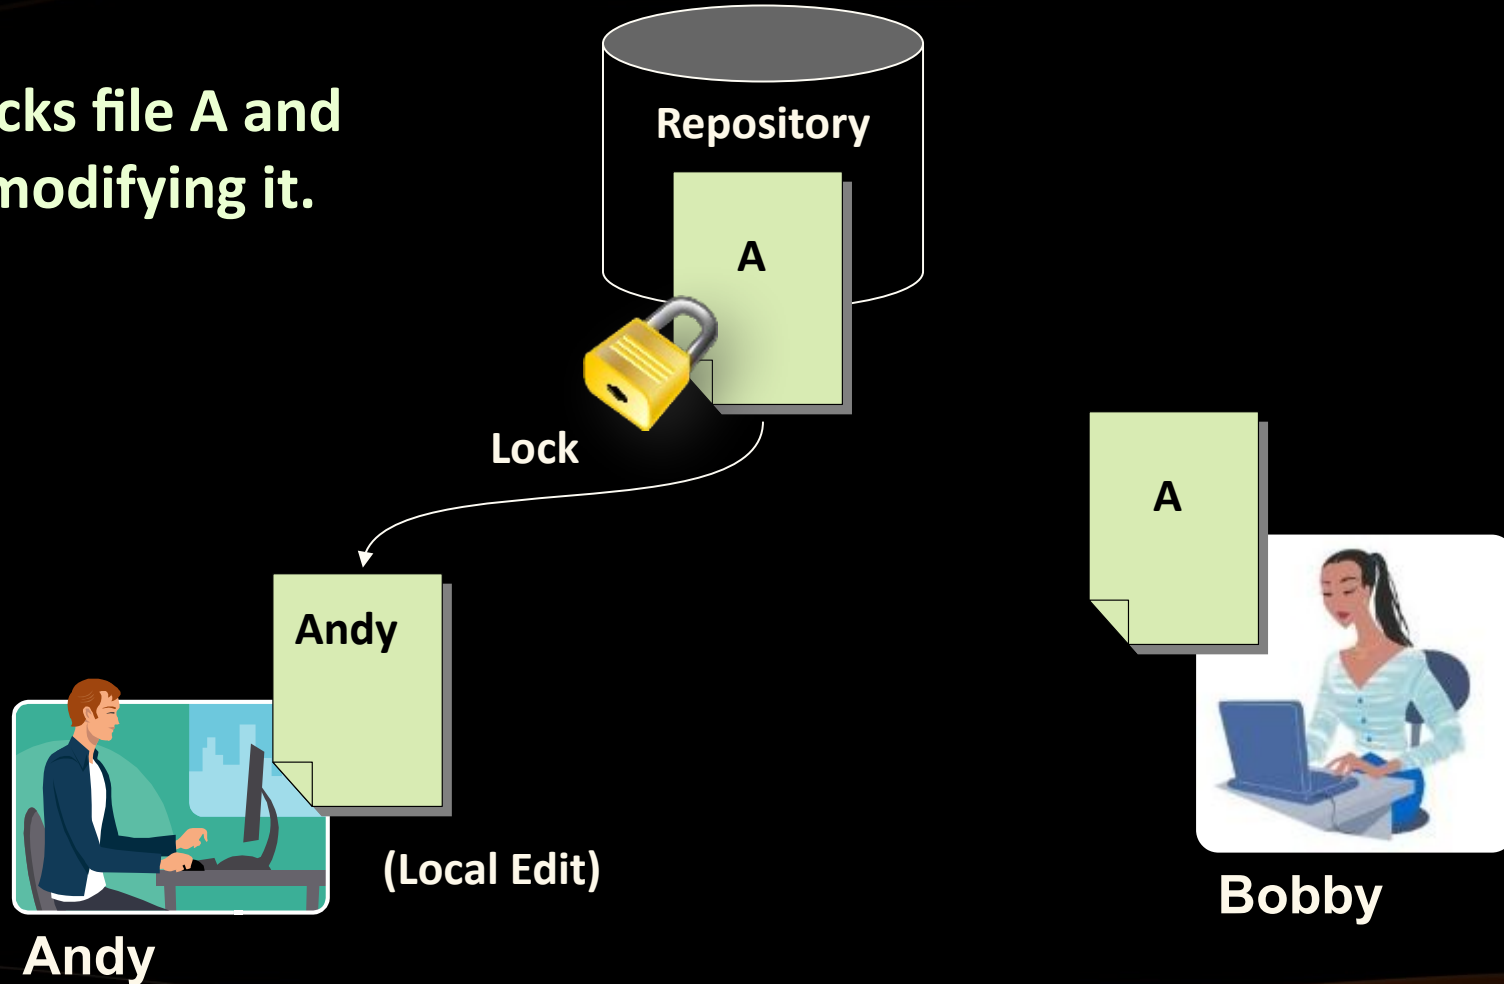

The check-out is done
without locking. They
just get a local copy.

The Lock-Modify-Unlock Model (2)

Andy locks file A and begins modifying it.

The Lock-Modify-Unlock Model (3)

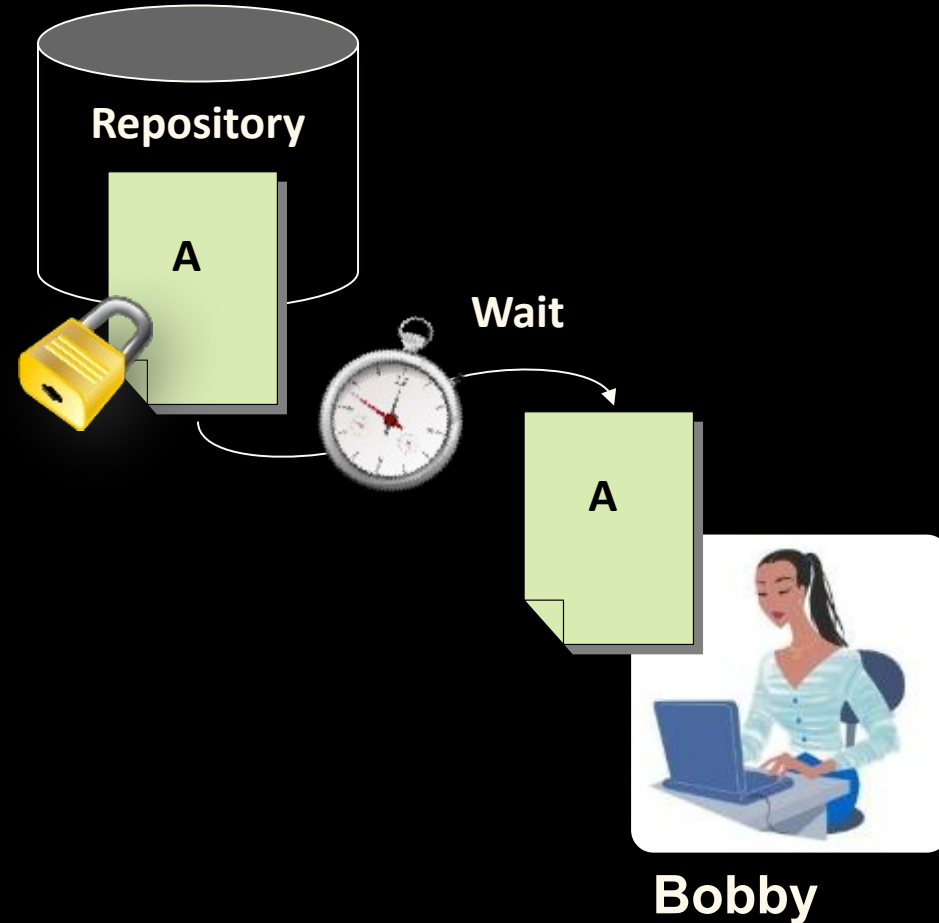

Bobby tries to lock the file too, but she can't.

Bobby waits for Andy to finish and unlock the file.

Andy

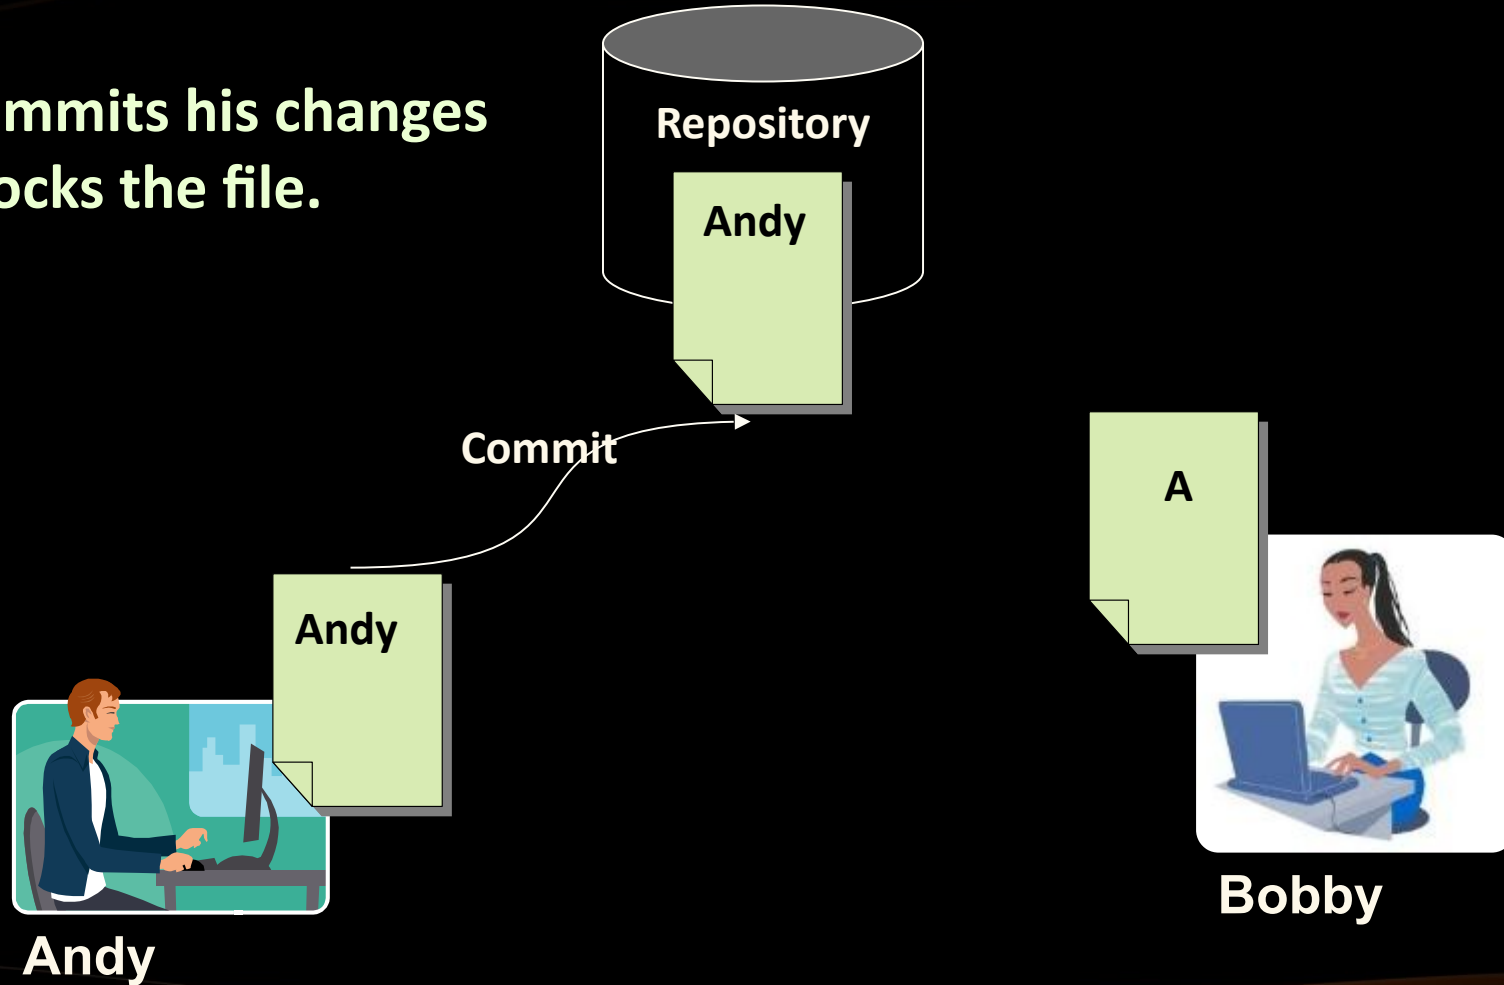

Bobby

The Lock-Modify-Unlock Model (4)

Andy commits his changes
and unlocks the file.

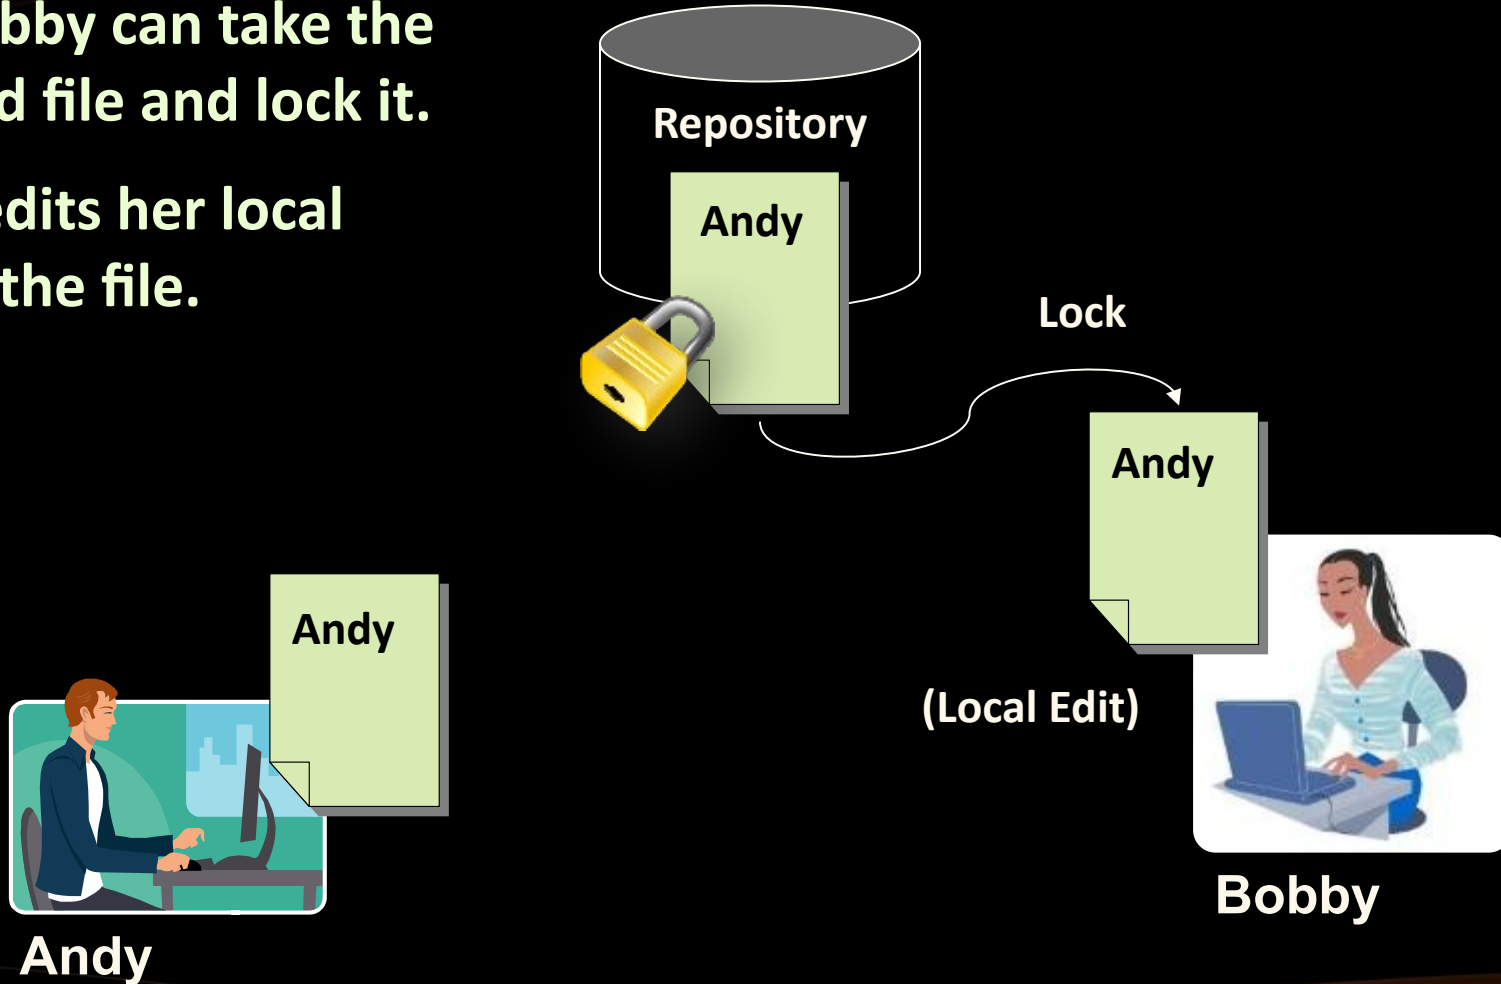

The Lock-Modify-Unlock Model (5)

Now Bobby can take the modified file and lock it.

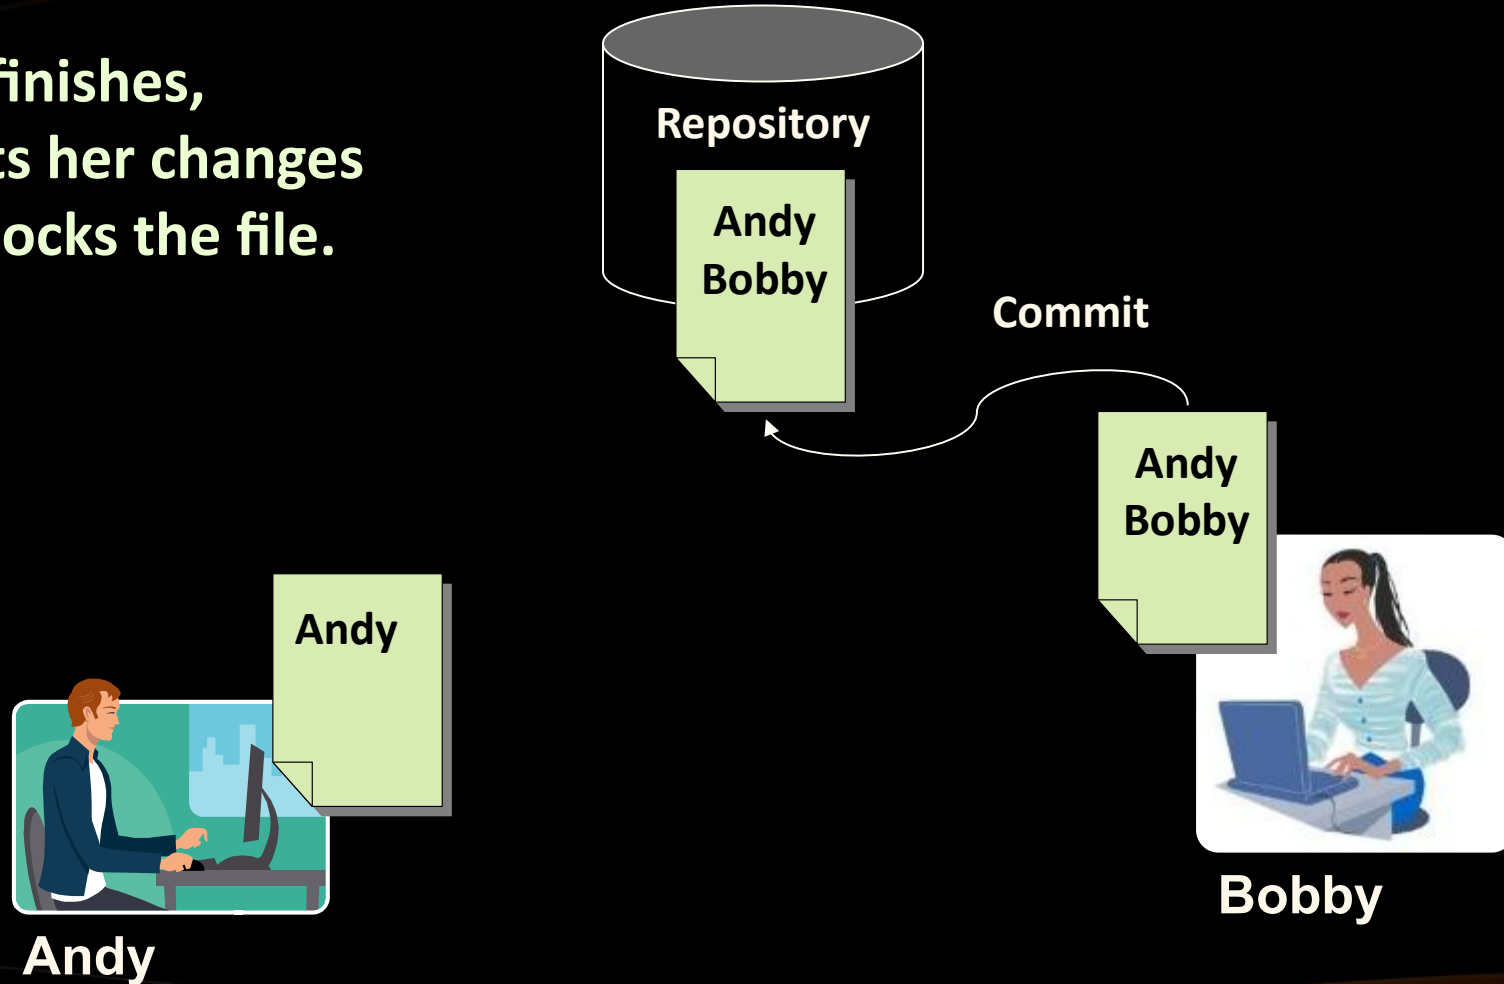

Bobby edits her local copy of the file.

The Lock-Modify-Unlock Model (6)

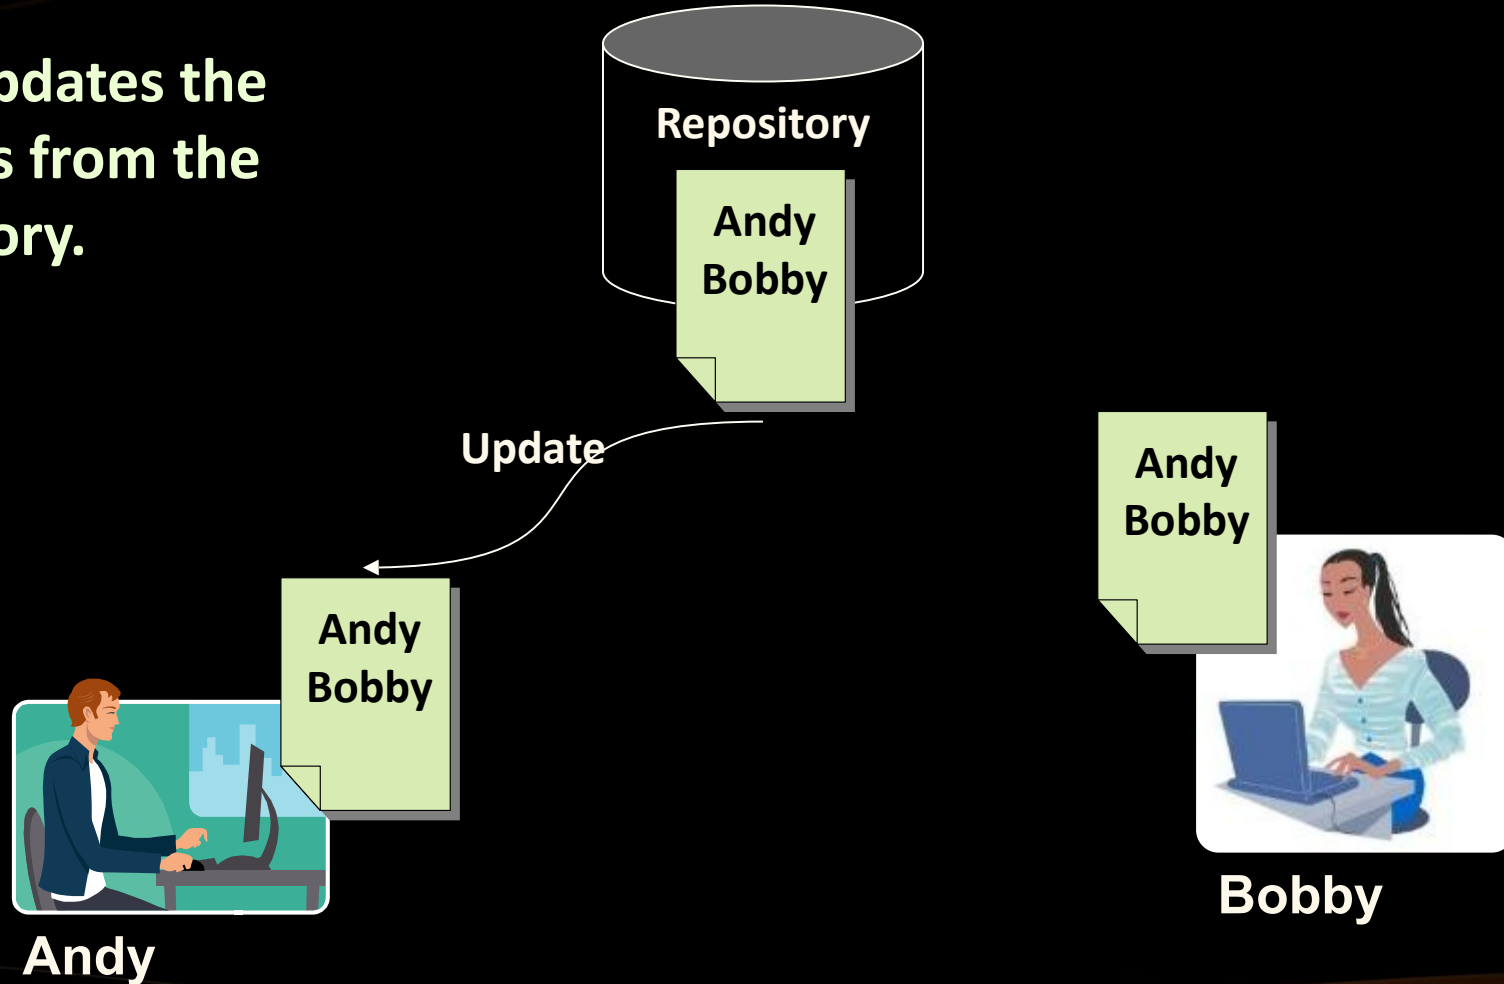

Bobby finishes,
commits her changes
and unlocks the file.

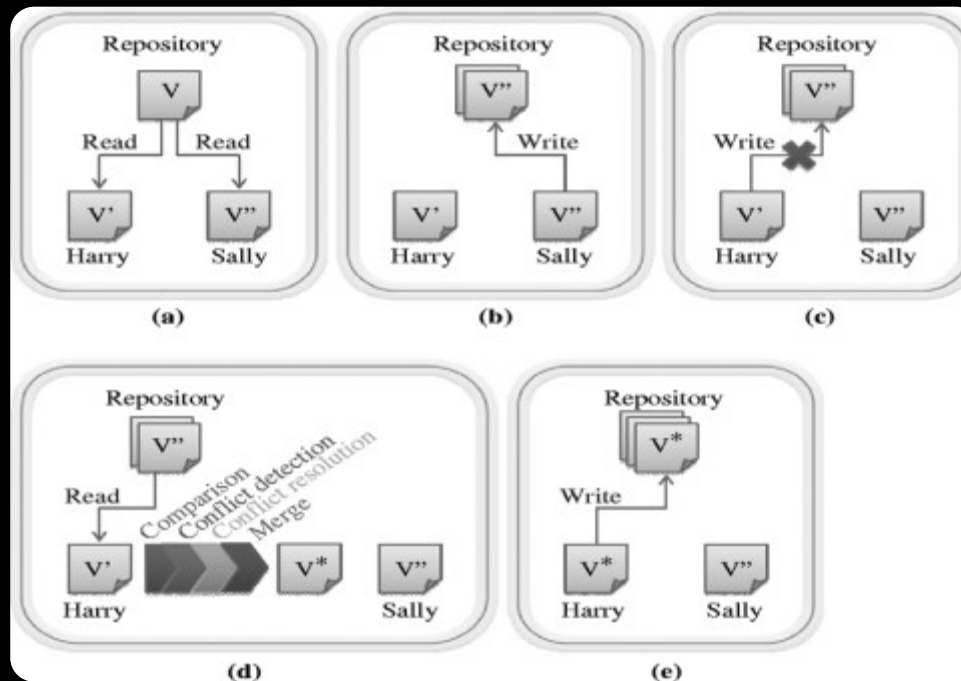

The Lock-Modify-Unlock Model (7)

Andy updates the changes from the repository.

The "Copy-Modify-Merge" Model

Team Foundation
Server 2012

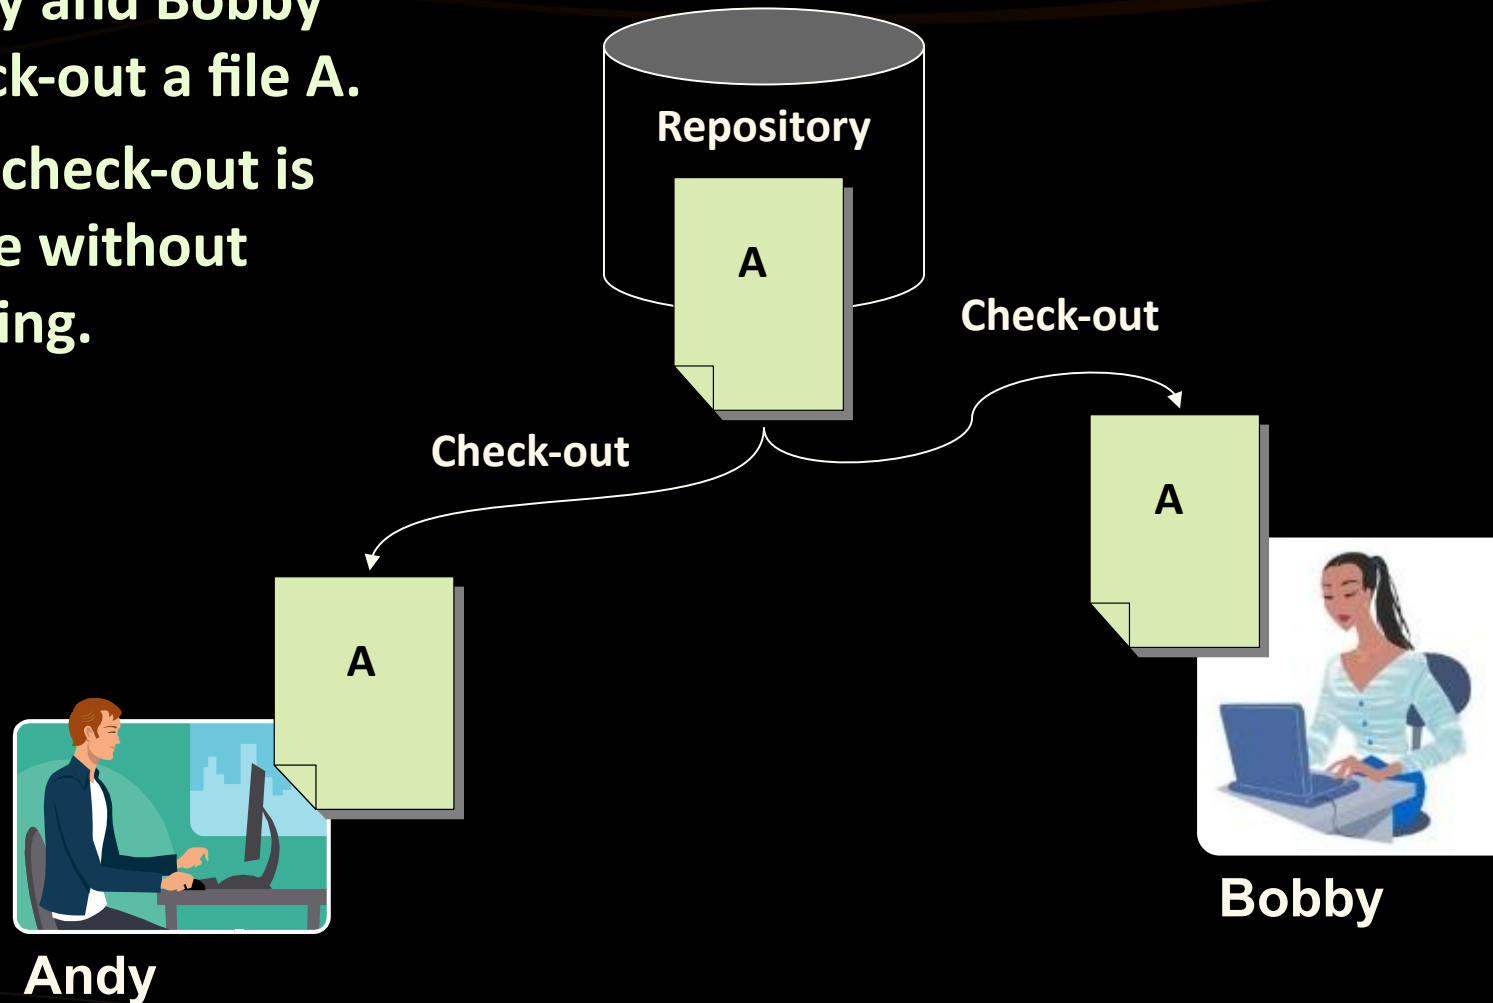

Microsoft

The Copy-Modify-Merge Model (1)

Andy and Bobby
check-out a file A.
The check-out is
done without
locking.

The Copy-Modify-Merge Model (2)

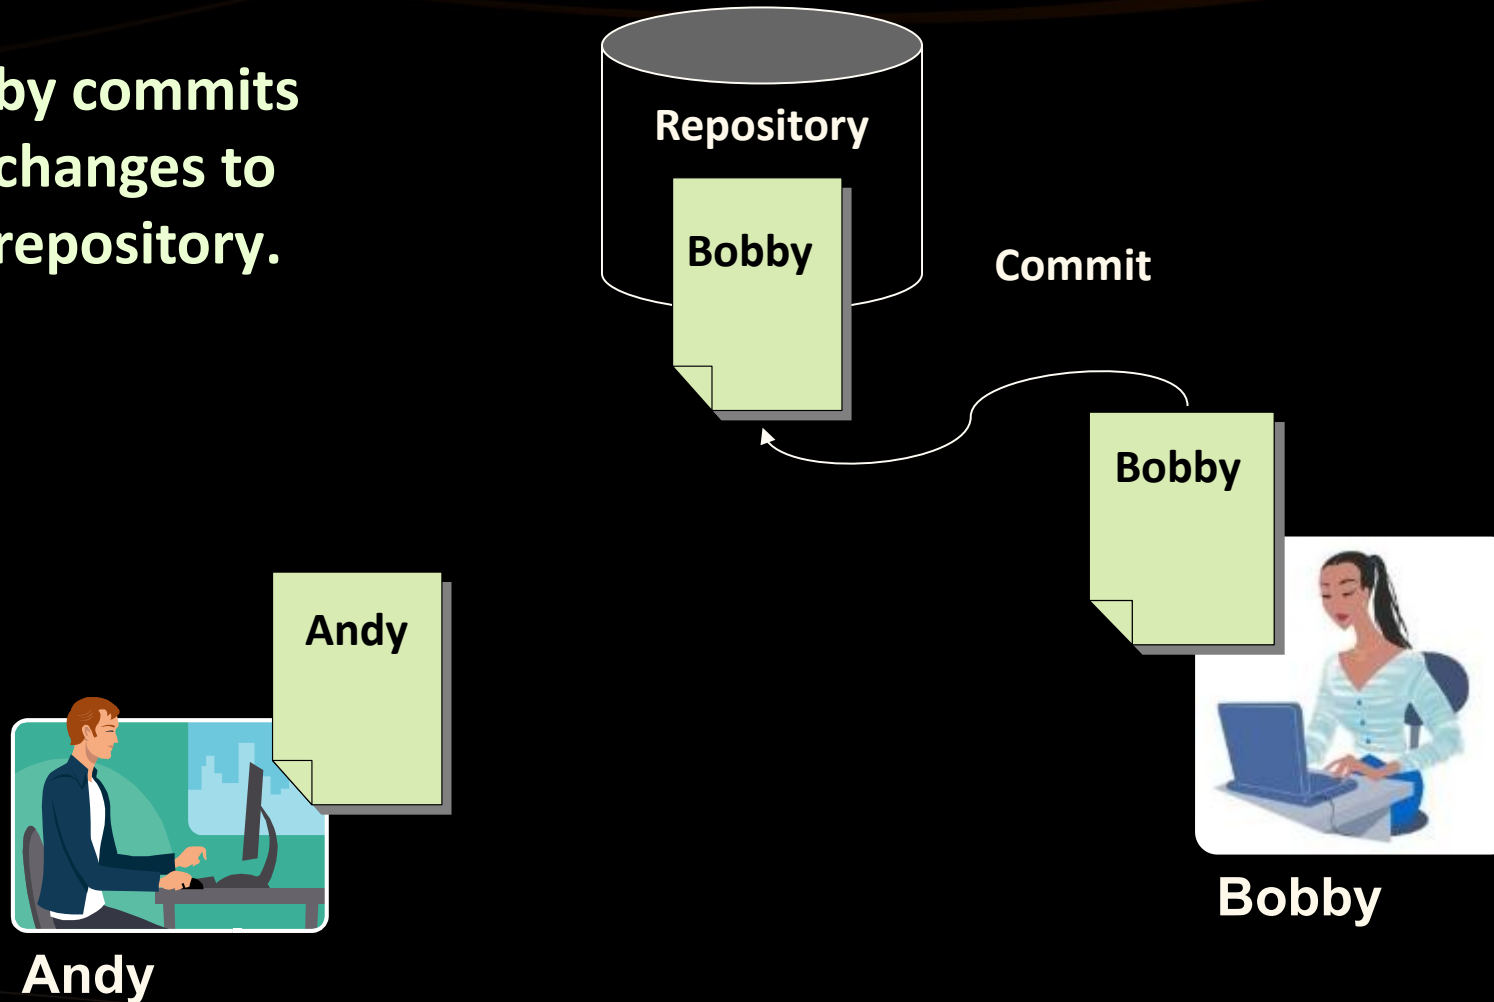

Both of them
edit the local
copies of the
file (in the
same time).

The Copy-Modify-Merge Model (3)

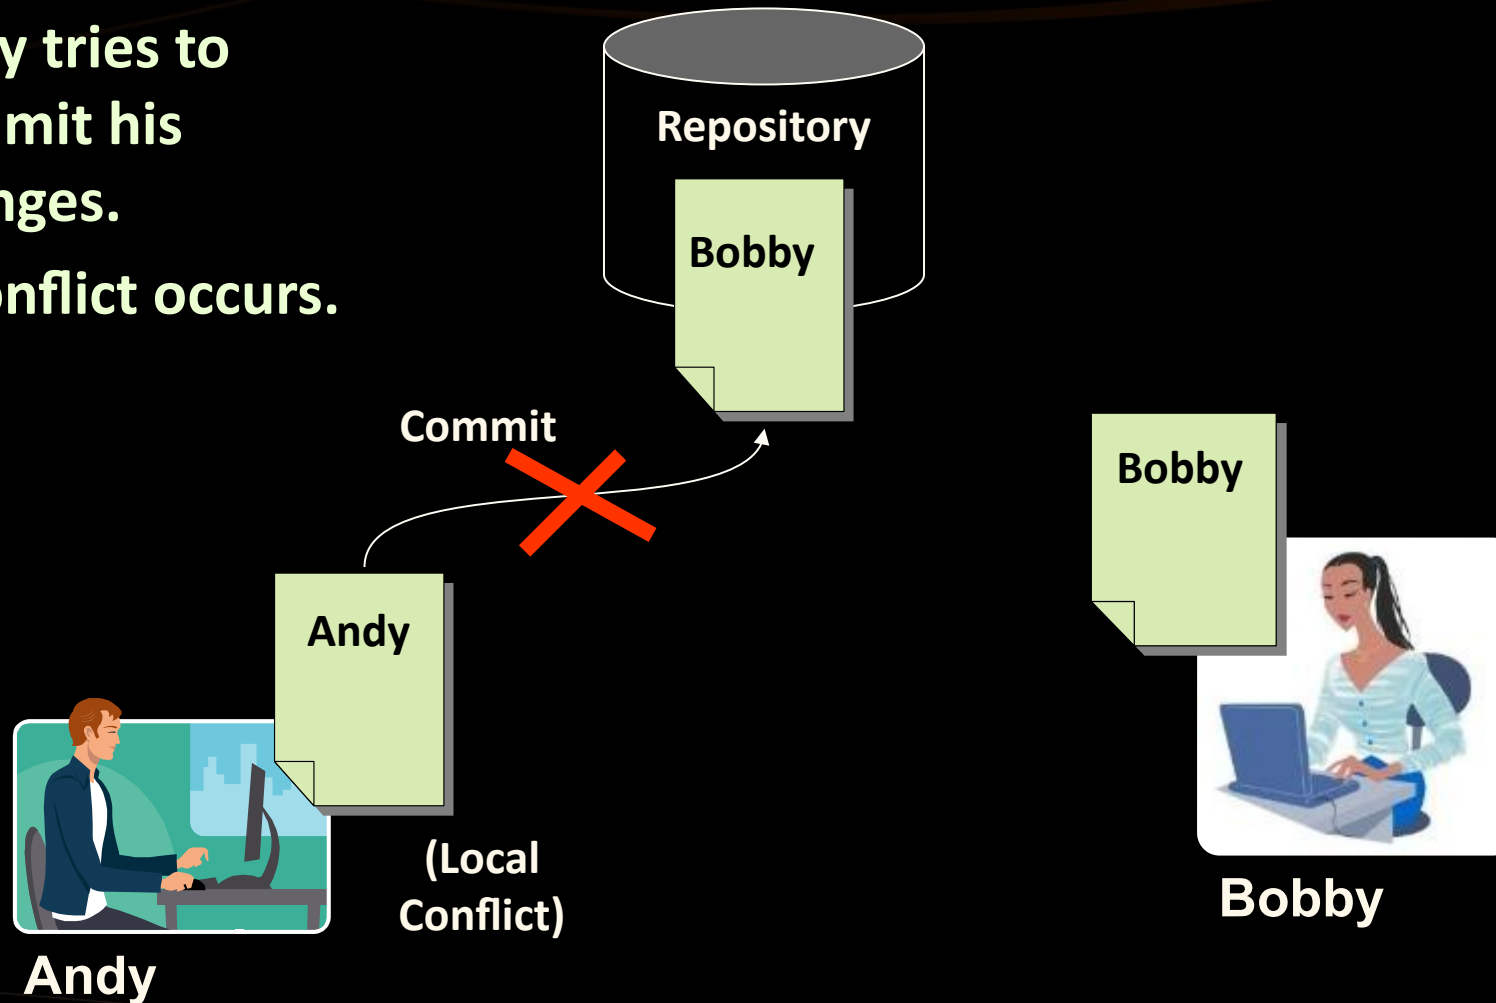

**Bobby commits
her changes to
the repository.**

The Copy-Modify-Merge Model (4)

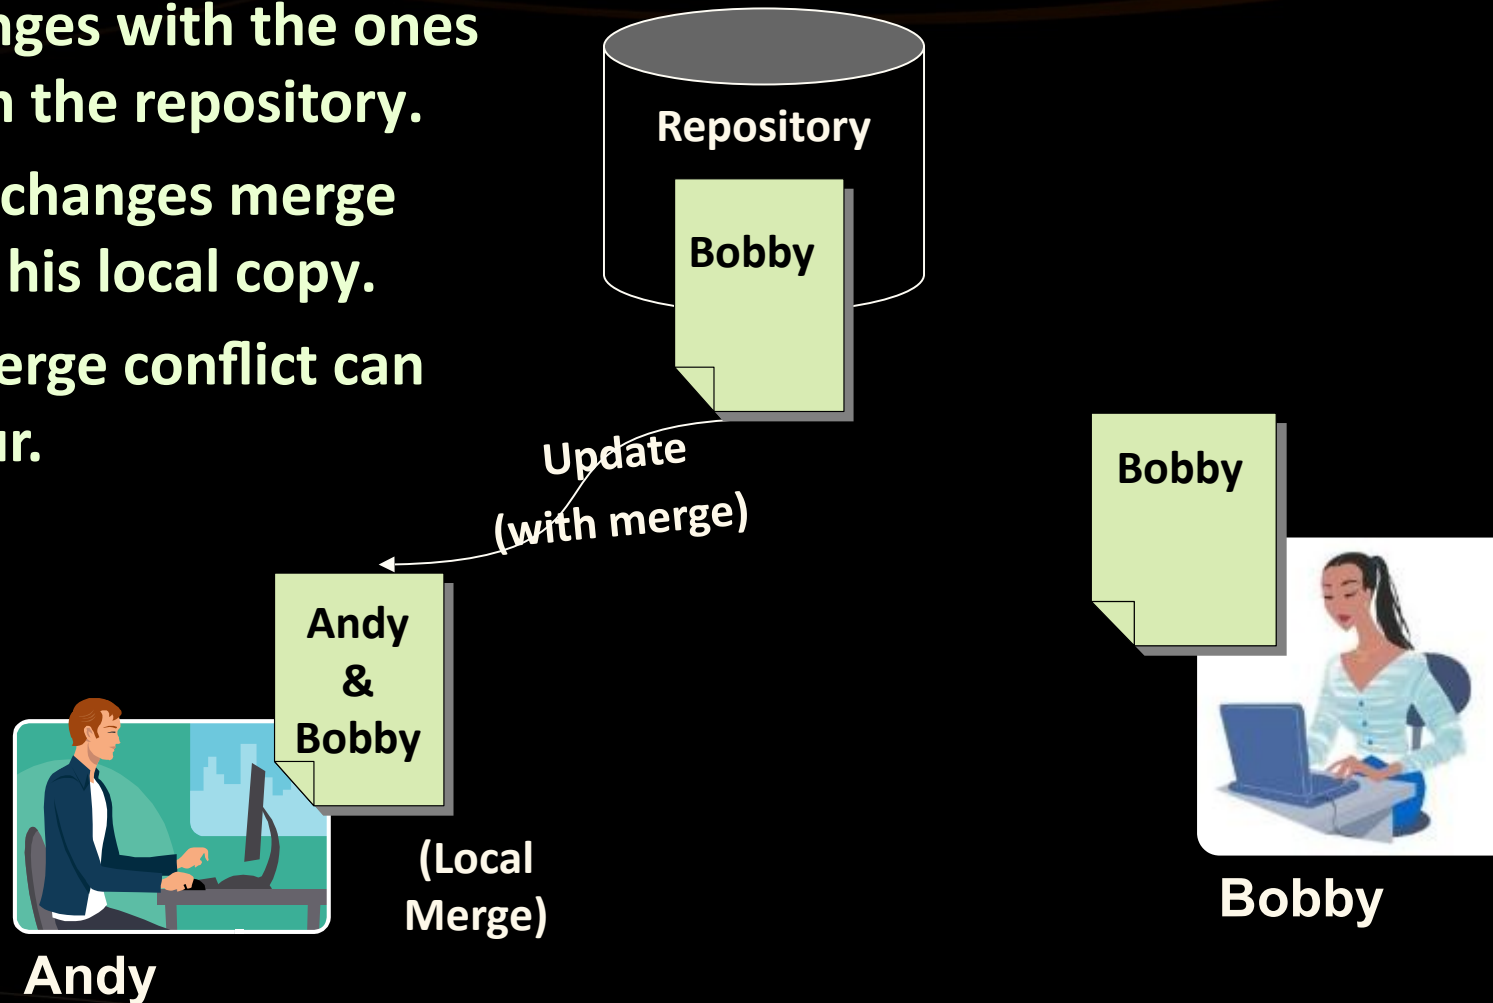

Andy tries to
commit his
changes.
A conflict occurs.

The Copy-Modify-Merge Model (5)

Andy updates his changes with the ones from the repository.
The changes merge into his local copy.
A merge conflict can occur.

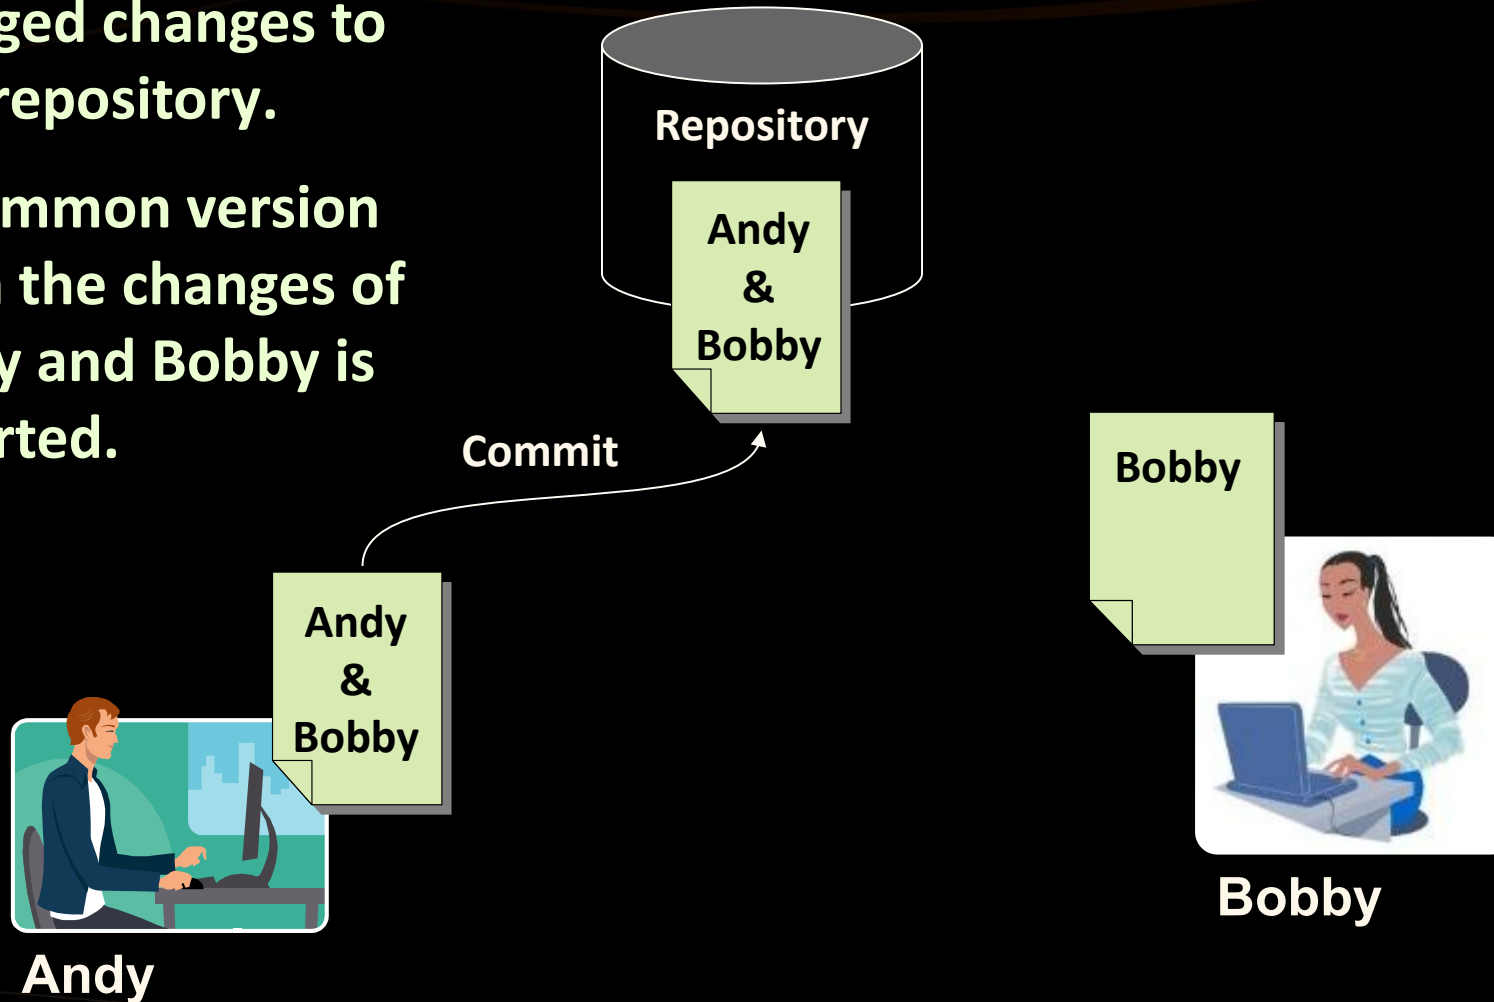

The Copy-Modify-Merge Model (6)

Andy commits the merged changes to the repository.

A common version with the changes of Andy and Bobby is inserted.

The Copy-Modify-Merge Model (7)

Bobby updates the changes from the repository.

She gets the common version with both changes from Andy and Bobby.

Andy

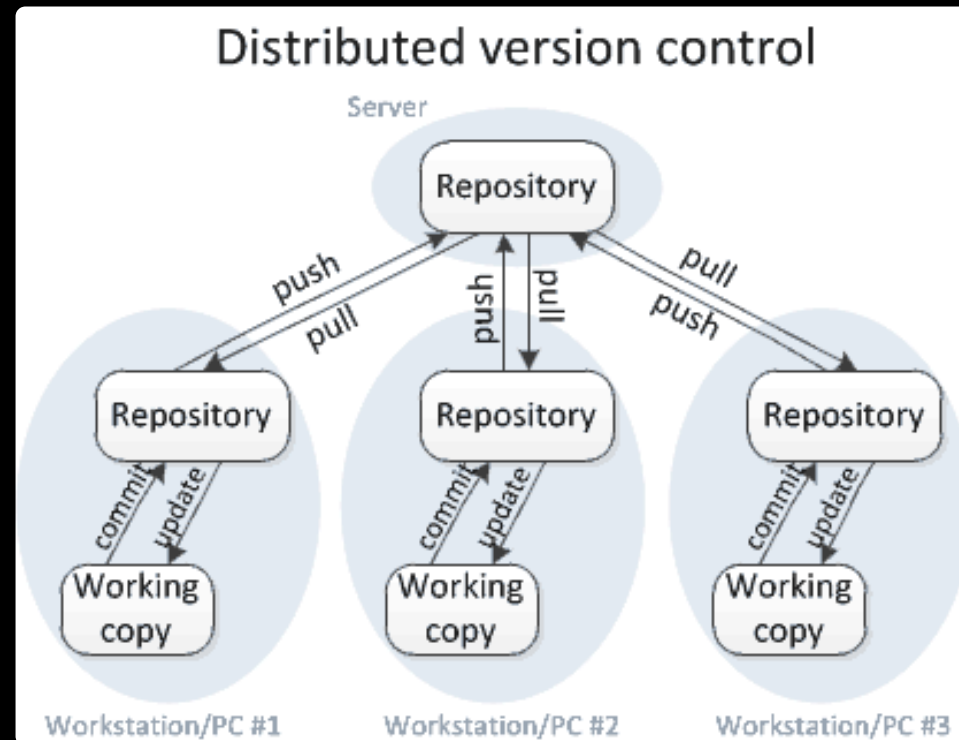

Update

Andy & Bobby

Bobby

The "Distributed Version Control" Versioning Model

Distributed Version Control (1)

Andy and Bobby
clone the remote
repository locally.

They both have the
same files in their
local repositories.

Andy

Bobby

Distributed Version Control (2)

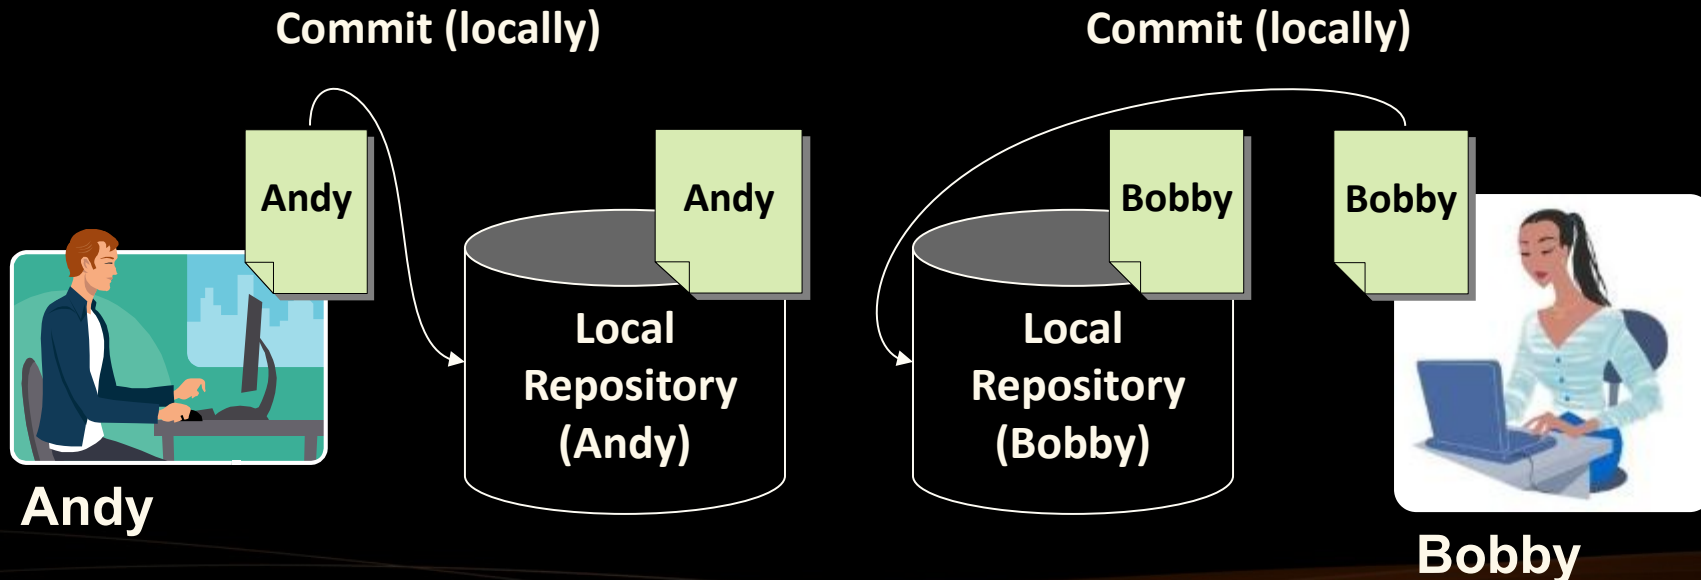

Andy and Bobby
work locally on a
certain file A.

Distributed Version Control (3)

Andy and Bobby
commit locally the
modified file A
into their local
repositories.

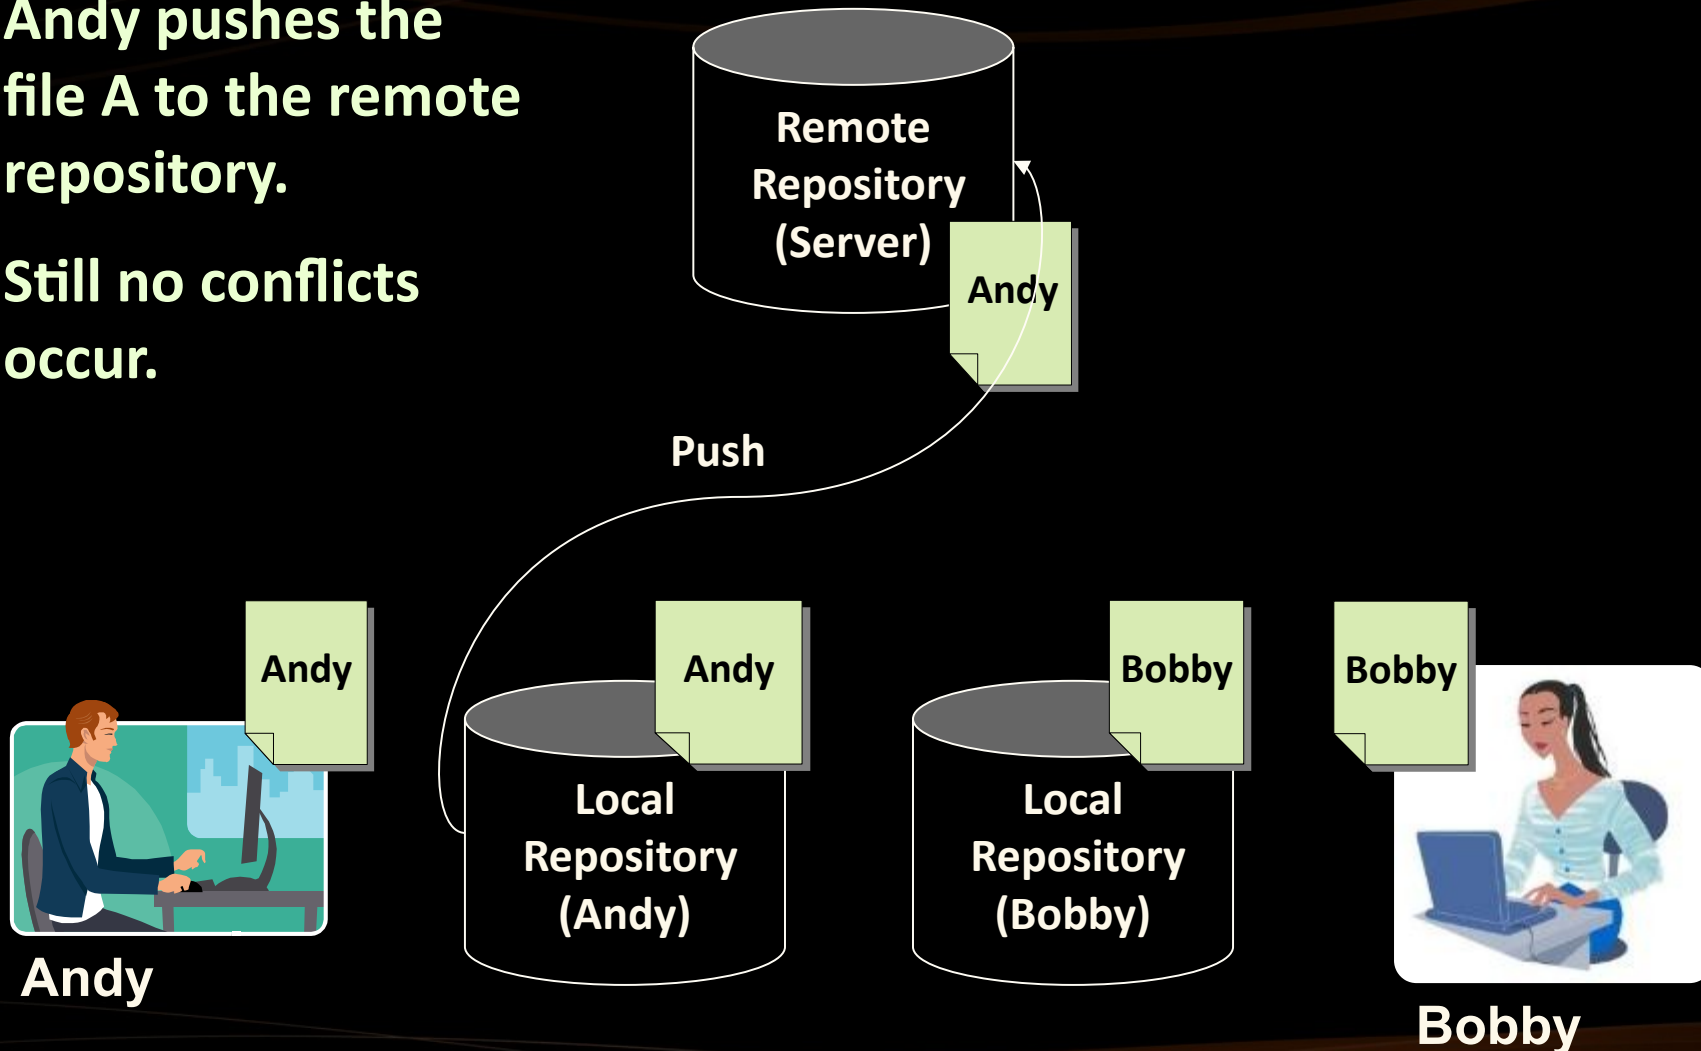

Distributed Version Control (4)

Andy pushes the
file A to the remote
repository.

Still no conflicts
occur.

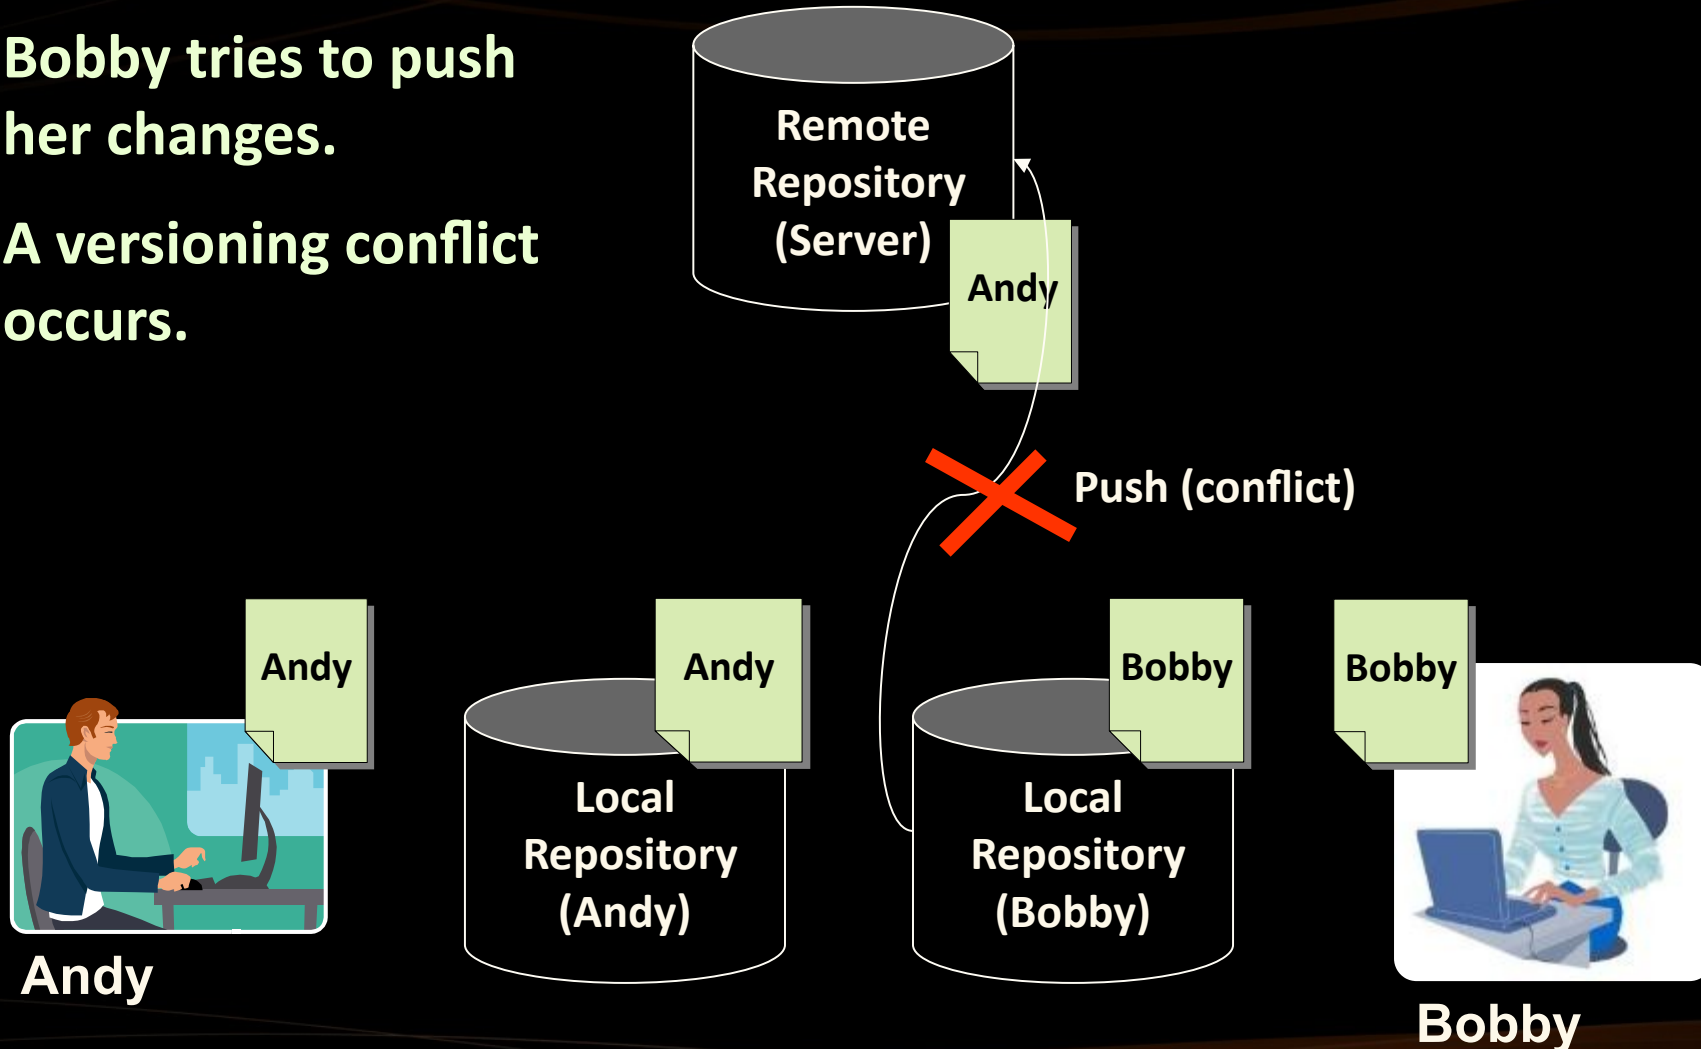

Distributed Version Control (5)

Bobby tries to push
her changes.

A versioning conflict
occurs.

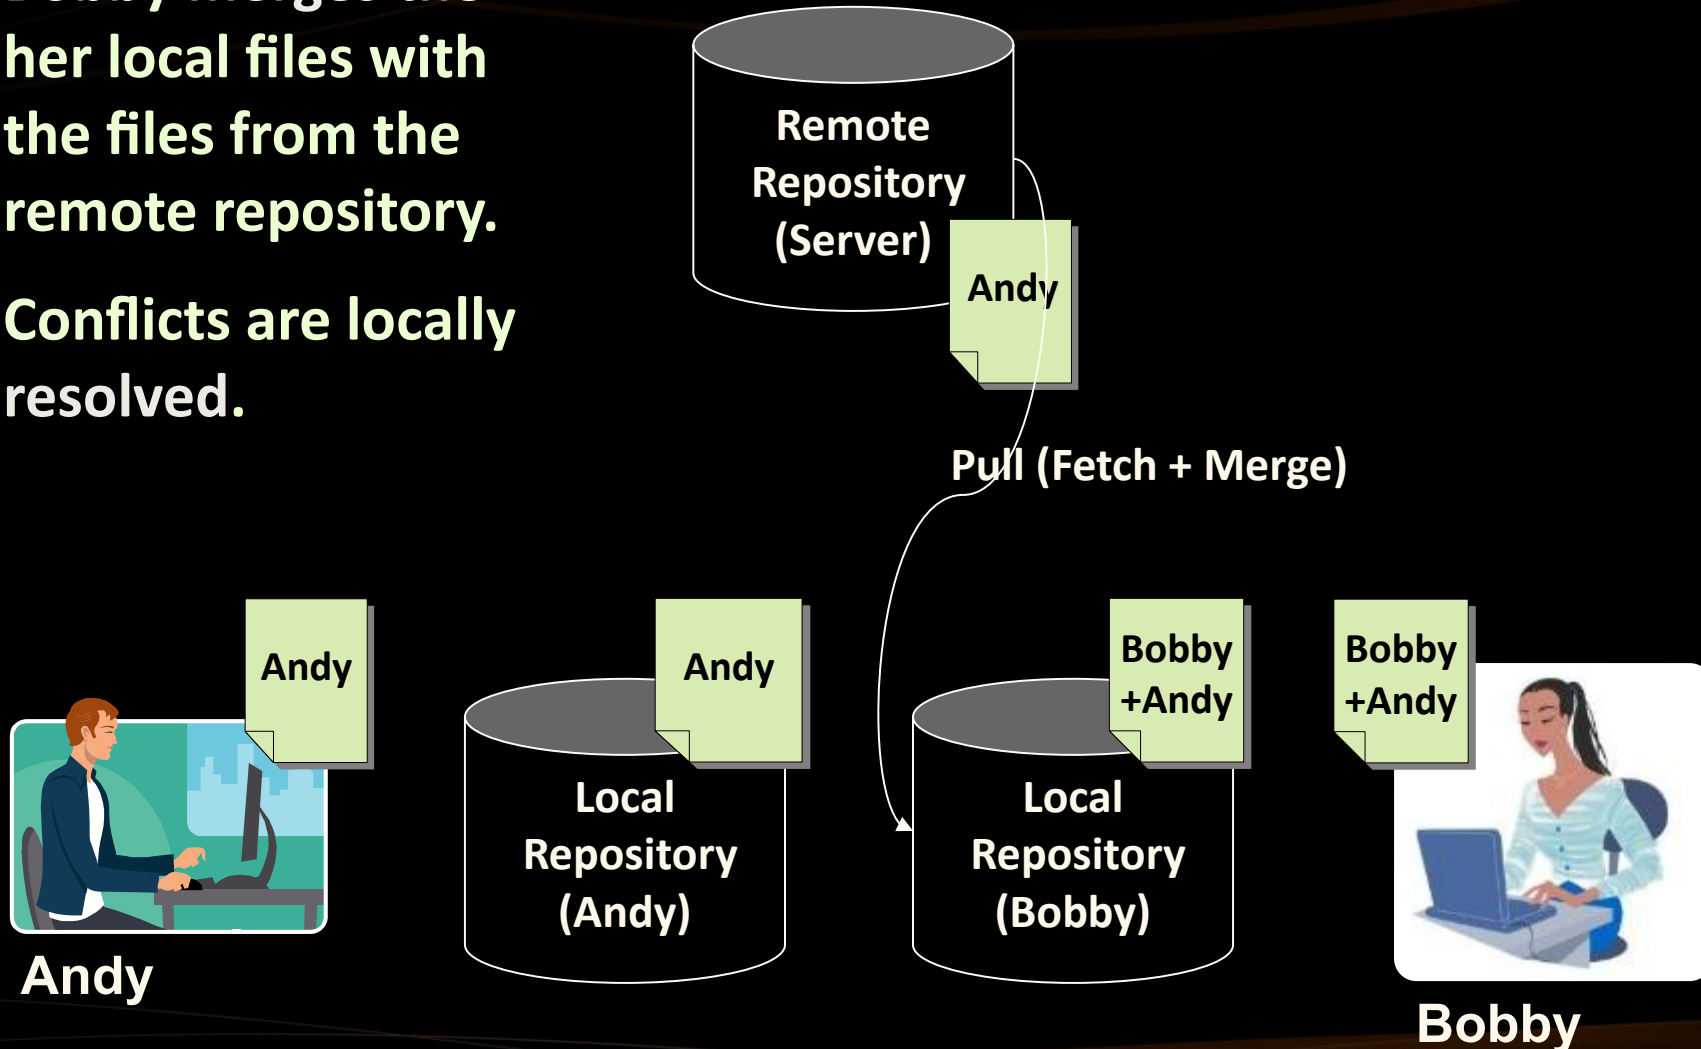

Distributed Version Control (6)

Bobby merges the
her local files with
the files from the
remote repository.

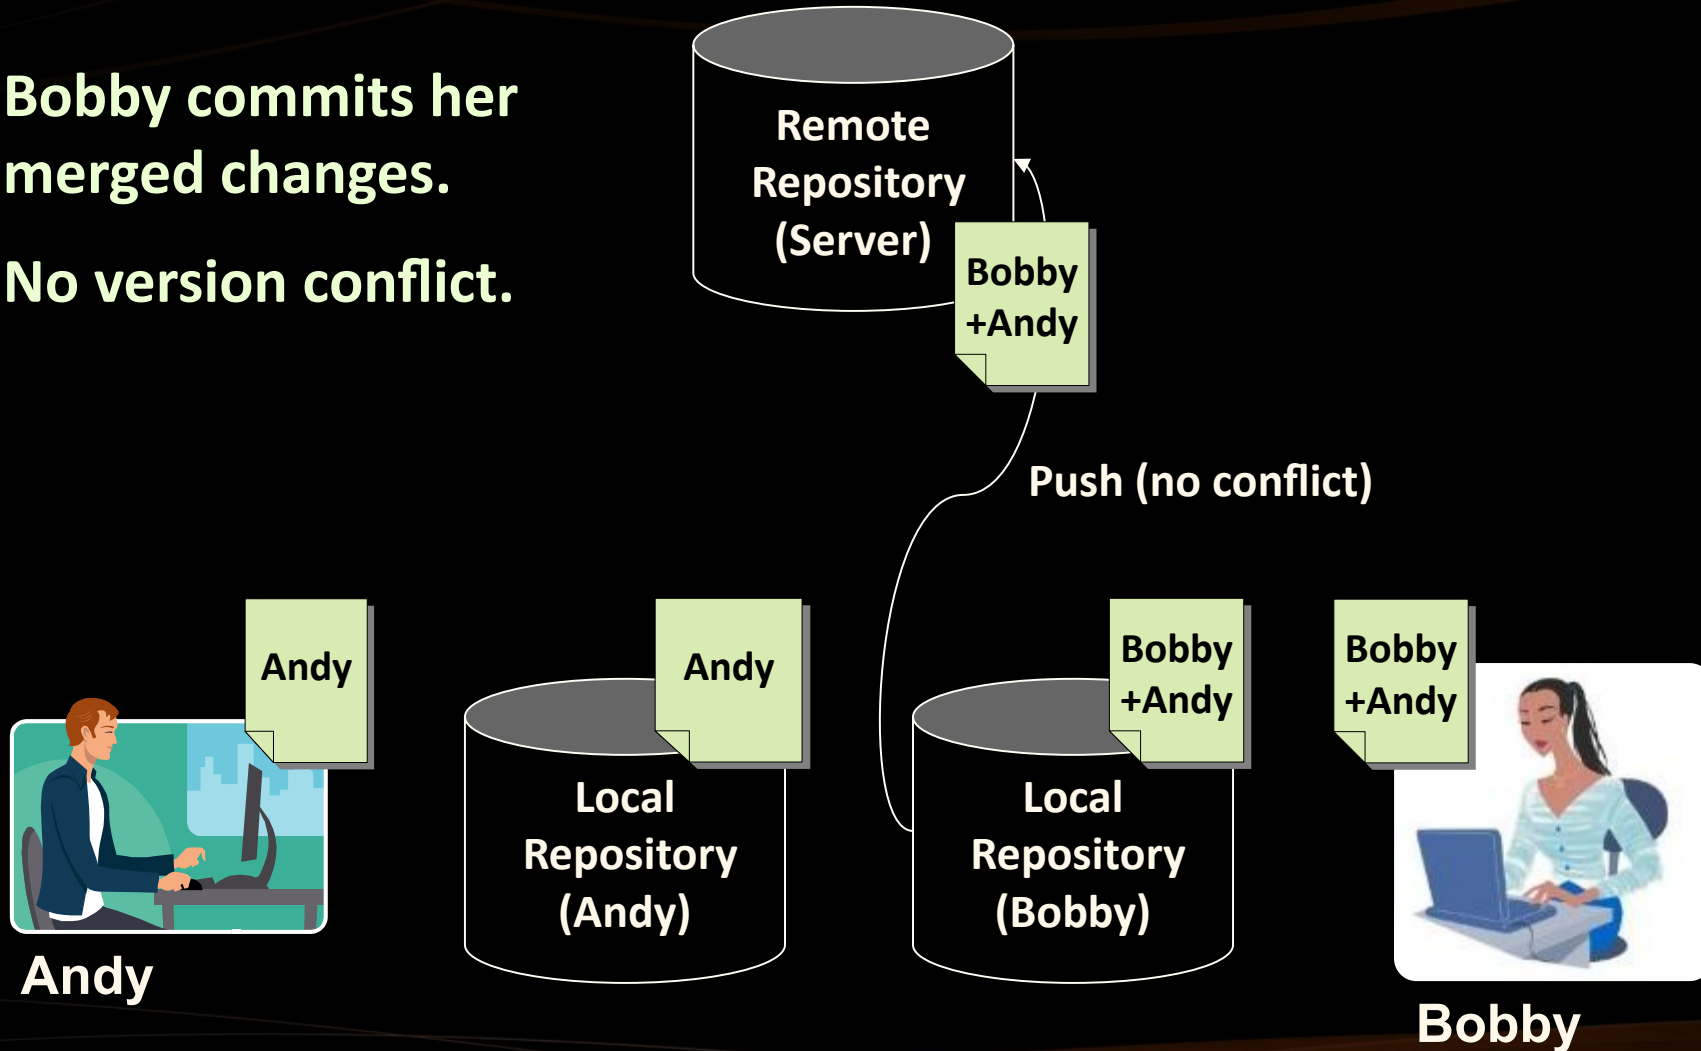

Conflicts are locally
resolved.

Distributed Version Control (7)

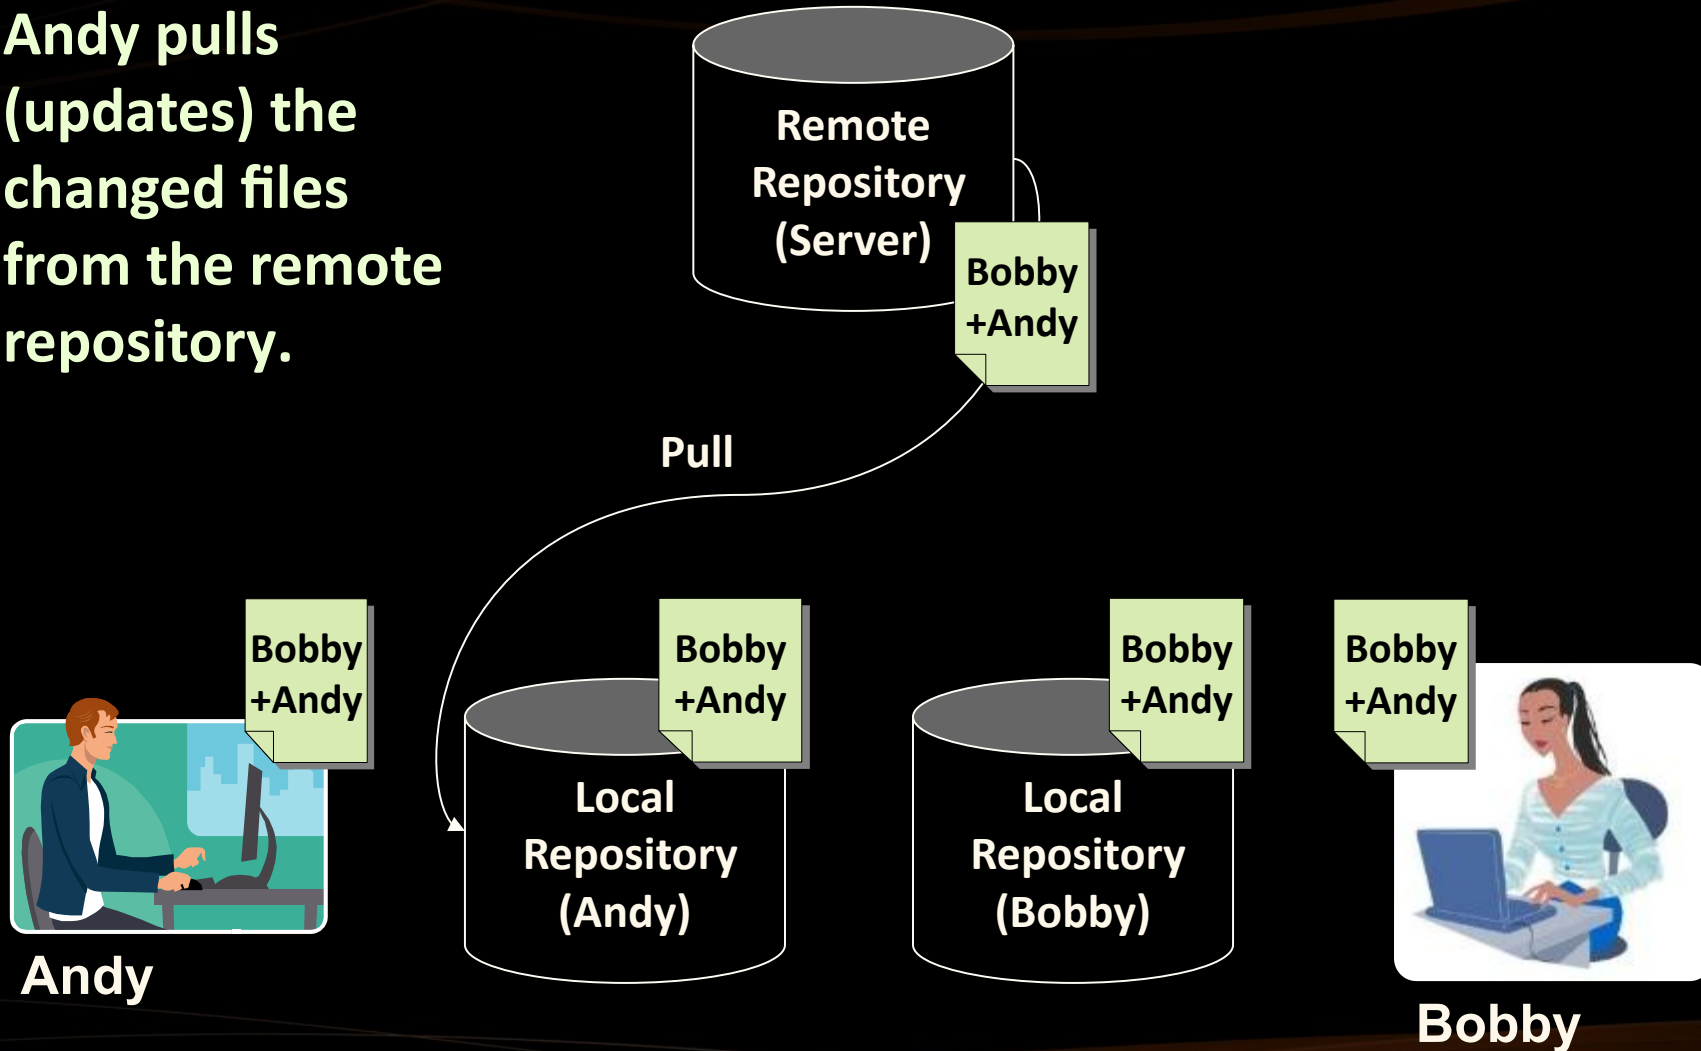

Bobby commits her merged changes.
No version conflict.

Distributed Version Control (8)

Andy pulls
(updates) the
changed files
from the remote
repository.

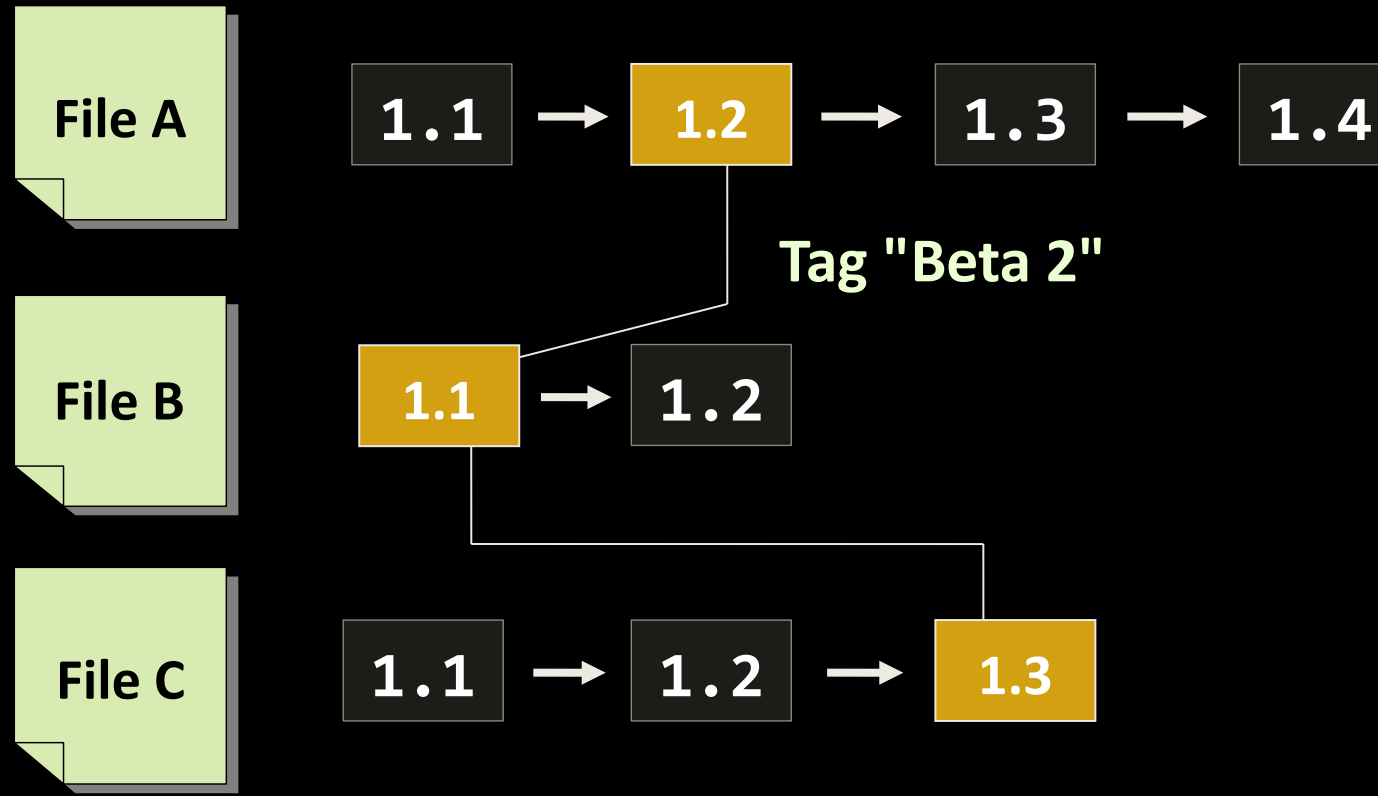

Tags and Branches

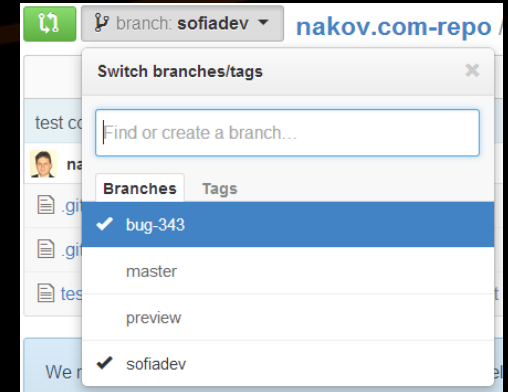

Tags

- Allows us to give a name to a group of files in a certain version

Branching

- **Branching** allows splitting the development line into separate branches
 - Different developers work in different branches
- Branching is suitable for:
 - Development of new feature or fix in a new version of the product (for example version 2.0)
 - Features are invisible in the main development line
 - Until merged with it
 - You can still make changes in the older version (for example version 1.0.1)

Merging Branches

- Some companies work in separate branches
 - For each new feature / fix / task
- Once a feature / fix / task is completed
 - It is tested locally and committed in its branch
- Finally it is merged into the main development line
 - Merging is done locally
 - Conflicts are resolved locally
 - If the merge is tested and works well, it is integrated back in the main development line

Branching – Example

Merging Branches – Example
